COMPANY PROFILE

About ThoughtsCrest

ThoughtsCrest Software is a banking technology services firm headquartered in Bengaluru, India, with a team of 100+ and growing consultants. We partner with banks and core-banking OEMs to deliver end-to-end core banking implementations, upgrades, integrations and modernisation programmes, backed by strong delivery governance.

120+	70+	13	4
Consultants	Project implementations	Countries served	Continents

Why banks and OEM teams work with us

Finastra-certified partner

Deep expertise implementing and extending Fusion Essence, with delivery practices aligned to OEM governance and a direct OEM support network throughout the programme.

Implementation depth

Strong engineering capability for core extensions and integrations, supported by reusable patterns, QA automation and full requirement traceability.

Product DNA, not just delivery

Our team was part of Fusion Essence (originally BankFusion Universal Banking) from its earliest development stages and has been involved in 80% of all Essence implementations.

INTRODUCTION

What we do

A single partner across the core banking stack — from platform implementation and process automation to agentic AI and quality engineering.

- **Core banking implementation**
  Fusion Essence modernisation
- **Customisation & integration**
  Core banking systems
- **Data migration**
  Migration factory approach
- **Workflow automation**
  Business process management
- **AI & machine learning**
  Applied banking solutions
- **Agentic AI solutions**
  Powered by Lyzr
- **Custom software & mobile**
  Application development
- **Managed services**
  Post go-live support
- **Quality engineering**
  Test automation with TestNova

SOLUTION 01

Banking

Core banking modernisation on Finastra Fusion Essence

Finastra Fusion Essence, implemented and extended by a team that helped build it. A cloud-native, API-first and modular core that supports retail, SME, corporate and Islamic banking on one platform.

Deposits & accounts

Current, savings, fixed and notice deposits, virtual accounts, Islamic deposits, multi-currency, EOD and 24/7 processing.

Lending

Secured and unsecured, revolving and fixed, commitments, limits, collaterals and Islamic finance.

Payments

Initiation, standing orders, balance orders, direct debits, incoming payments and payment schemes.

Treasury

FX, money market and interest rate swaps, with treasury support in the core ledger.

Digital engagement

Mobile, online and self-onboarding, digital branch, teller, chatbot and product composer.

Analytics

Customer 360, product, financial and operational dashboards, predictive and prescriptive data.

Cloud native · API first · Modular · Automation · Data reuse

Fusion Essence is positioned a SPARK Leader in Retail Core Banking Systems, EMEA and Asia Pacific (QKS Group, Q4 2025).

ThoughtsCrest Software Private Ltd.

SOLUTION 01 · BANKING

Process automation and delivery

Solution accelerators layered over the core, delivered through a six-phase implementation methodology with governance at every stage.

Customer onboarding

InstaKYC with mobile capture, account opening workflows, loan and credit card origination, activity dashboards across branches.

Retail & commercial lending

Origination to disbursal: credit scoring, de-duplication, blacklist and fraud checks, collateral management, restructuring and collections.

Trade finance

Export, import, negotiation, quotation and remittances on a centralised trade hub, extendable to low-volume branches.

Payments & settlements

A single hub across ICCS, EFT, ACH, RTGS, SWIFT, mobile payments, direct debit and post-dated cheque management.

SWIFT straight-through processing

Inward and outward remittances with rules-driven routing, real-time exception handling, reconciliation and archival.

Compliance & reporting

FATCA initiation, classification, remediation and reporting; wealth management reporting with multi-lingual, multi-currency output.

Initiate · Define · Build · Test · Deploy · Close

Implementation methodology governance across stakeholder alignment, budget control, change control and standard documentation.

Proof point: ZB Holdings, Zimbabwe — full core banking transformation delivered in 12 months, with zero core customisations and 750,000 customers migrated.

SOLUTION 02

Insurance

Why insurers are modernising their operations

Insurers face growing demand for remote, touchless operations while staying compliant. Our solutions cover life, health and general insurance across underwriting, servicing and claims.

Key challenges

- Dwindling customer loyalty
- Rising customer acquisition costs
- Growing operational expenses
- High turnaround time in customer service
- Document handling costs from manual processes
- Error-prone underwriting and delayed claims
- Inefficient fraud management
- Gaps in regulatory compliance

71%

of consumers use digital research — price comparison or social media — before buying insurance

26%

of those consumers actually purchase their policy online

The gap comes from lengthy online journeys, ineffective customer communication, siloed processes and delayed responses to requests — all of which automation is designed to close.

SOLUTION 02 · INSURANCE

End-to-end insurance automation

Policy underwriting, servicing and claims processing on one platform, integrating point applications so information flows without losing data integrity.

Policy underwriting

Automatic classification of proposals as straight-through or non-straight-through. Rule-driven risk scoring, plus duplicity, AML, fraud and blacklist verification for faster, better-informed decisions.

Policy servicing & administration

Automates the full service-request lifecycle with policy administration system integration, parallel processing of multiple requests, and traceability through automated reminders and escalations.

Claims processing

First notice of loss through settlement, recovery and closure. Automated case routing by adjudicator workload and complexity, fast-track rules, and real-time claim registration and status tracking.

Touchless customer onboarding

Video-based identification and paperless KYC completes onboarding in minutes while meeting security and regulatory requirements — no branch visit, no physical documents.

Insurance distribution management

Web and mobile application for agents, brokers and distributors: lead management, customer need analysis, quotation generation with illustrations, point-of-sale issuance and claims filing on the move.

Faster product rollout · Geography-specific compliance · Fewer fraudulent claims · Better underwriting decisions · Real-time policy and claims visibility

SOLUTION 03

Digital Solutions

Content services and low-code process automation

A unified digital transformation platform with native process automation, content services and communication management — the foundation of our EDRMS and ECM programmes across Africa, MEA and APAC.

Enterprise content management

OmniDocs ECM for content and records management with version control, retention and audit trails; OmniScan for high-volume distributed capture; OmniXtract for intelligent data extraction; NewgenONE iBPS for low-code process and case management.

Accounts payable automation

Invoice capture through to payment: automated extraction, PO and non-PO matching, rules-based approval routing, exception handling and ERP integration.

Digital account opening

Omnichannel onboarding with e-KYC and video KYC, document capture at source, straight-through processing for clean applications and core banking integration for instant activation.

Marvin AI

Newgen's GenAI layer embedded across ECM, BPM and CCM — conversational process modelling, document summarisation and instant visualisations, with content staying in your environment and PII never reaching a public model.

Where we deploy it

- EDRMS and DMS for public sector and banking
- Loan and customer file digitisation
- Customer communication management
- Digital mailroom and centralised capture
- Case management and service requests
- Records compliance and audit readiness

ThoughtsCrest Software Private Ltd.

SOLUTION 03 · DIGITAL SOLUTIONS

The ThoughtsCrest product suite

Proprietary products built from what we kept rebuilding on banking programmes — plus the engineering services that surround them.

AuditOne

Transaction auditing for core banking

Independent verification of transactions and accounting entries against expected outcomes, giving audit and risk teams continuous assurance rather than sample-based checks.

Asset360

Fixed asset management

Full asset lifecycle from acquisition to disposal: registers, depreciation schedules, transfers, revaluation and reconciliation against the general ledger.

FinLink

No-code integration middleware

Connects core banking to surrounding systems without bespoke integration code — configurable adapters, message transformation and monitoring.

Surrounding engineering services

- **Custom software & mobile** Application development for banking-specific gaps
- **Data migration** Migration factory approach with reconciliation
- **Managed services** Post go-live support and application maintenance
- **Customisation & integration** Core extensions with reusable patterns and traceability

SOLUTION 04

Lyzr AI

The Agent OS for enterprises

ThoughtsCrest is Lyzr's implementation partner for BFSI. Lyzr is a full-stack agent platform — framework, no-code studio and organisational intelligence layer — deployed inside your own cloud.

Enterprise by design

100% data privacy, LLM agnostic, cloud agnostic and open source. Deployed on your cloud with no data leaving your estate.

Built-in guardrails

Responsible AI, a Hallucination Manager and Agent Eval are part of the platform, not bolt-ons — the differentiators against Agentforce, LangChain and CrewAI.

Full platform stack

Lyzr Agent Framework, Agent Studio for no-code agent building, and OGI (Organizational General Intelligence) with knowledge graph and managerial orchestration.

Compliance and speed

SOC 2, ISO 27001 and GDPR compliant. Plug-and-play with no tech debt — agents deployed in weeks, not quarters.

Credentials

- Featured by AWS as an AI agent platform within the Bedrock ecosystem; agents built natively on AWS Bedrock and OpenAI
- Chosen as a top-3 agent platform by one of the world's largest banks
- Built on by AWS, Accenture, KPMG, NVIDIA, Infosys, TCS, EY, PwC, Morgan Stanley and Walmart

ThoughtsCrest Software Private Ltd.

SOLUTION 04 · LYZR AI

Super agents for banking and insurance

Two pre-built domain super agents, each orchestrating a suite of specialised agents with human-in-the-loop verification at the points that matter.

Amadeo

lyzr.ai/amadeo

Banking Super Agent

- Customer onboarding
- Loan origination
- Document verification
- Regulatory and compliance monitoring
- Refund processing
- Customer service
- Compliance and audit readiness

Benjie

lyzr.ai/benjie

Insurance Super Agent

- Policy underwriting
- Policy administration
- Claims processing
- Risk assessment
- Partner quality assurance
- Customer service

Agents already deployed and demonstrable

Claims Processing	KYC Verification	Regulatory Monitoring	Cross-Border Payments
Customer Onboarding	Life Insurance Assistance	Retirement Planning	Customer Refund

USE CASE · THOUGHTSCREST × LYZR AI

BankDesk AI — an agentic IT helpdesk

A working example of the partnership: an AI-first internal support desk that resolves routine tickets end to end, escalates the rest with a recommendation, and integrates into Fusion Essence and ManageEngine ITSM.

1 Employee

Submit ticket

Form with category, priority and up to five attachments; fields configured per category by admin.

2 Lyzr AI

AI agents process

Two-stage pipeline — FAQ Agent then CoreBank Agent. Every response carries a confidence tag.

3 System

Resolve or escalate

High confidence auto-closes the ticket. Low confidence escalates to the IT queue at HIGH priority.

4 IT staff

IT review and decide

Decision panel compares current value against the AI proposal. Approve and the AI acts; reject and it closes.

5 Employee

Ticket closed

Rating out of five and feedback captured. Staff replies are relayed back so the AI learns the decision.

What it does

Role-based dashboards for employee, IT support and admin. Live ticket queue with stat cards, reassignment and least-busy auto-assignment on escalation. Admin-configurable categories and form schemas that apply to new tickets without a redeploy. Separate internal AI chat for staff with full system data access.

How it is built

React and Vite front end, Spring Boot 3.2 on Java 17, PostgreSQL. WebSocket broadcasts every ticket event live, so no polling and no refresh. Lyzr orchestration reaches enterprise tools through an MCP server, with OAuth token management, RAG over policies and runbooks, and audit logging throughout.

What it costs

Usage-based pricing at roughly $0.10 to $0.40 per AI-resolved ticket — a fraction of manual handling. Costs scale with ticket volume rather than headcount, with no per-seat licensing and no idle capacity to fund. Engineers keep the complex work; the AI clears the repetitive queue.

Bilingual: English ⇄ Kiswahili · Real-time updates · Role-based access control · Full audit trail · Fusion Essence + ManageEngine integration

ThoughtsCrest Software Private Ltd.

SOLUTION 05

TestNova

Banking automation that actually works like a bank

Traditional tools test code. Banks run on processes. TestNova validates entire business processes across integrated banking systems, so you deploy with confidence, speed and audit-ready evidence.

Traditional tools	TestNova
Validates code logic in isolation	Validates integrated business processes end to end
Uses fixed, static test data	Uses dynamic, date-sensitive data
Checks whether the script ran	Verifies whether the bank actually worked
No awareness of time or EOD cycles	Simulates multi-day workflows and EOD cycles
Tests one system at a time	Orchestrates across all connected systems
No audit-ready evidence generated	Auto-generates logs, reports and screenshots per run

A single loan origination touches multiple systems at once, spans several business days and keeps changing as interest accrues, penalties apply and statuses shift. Generic tools miss all of it.

ThoughtsCrest Software Private Ltd.

SOLUTION 05 · TESTNOVA

Architecture, time awareness and value

1 Scenarios

A Python script paired with an Excel data sheet. Each row is one unique execution — the atomic unit of testing.

2 Business Processes

A sequence of scenarios chained together to mirror a real banking workflow, such as a full loan origination.

3 Test Runs

Scheduled execution of a business process with a chosen data set. Versioned, tracked and fully automated.

Time-aware testing

Dynamic dates

Relative Business Date logic keeps tests valid as the live environment moves — no manual data refresh.

EOD cycles

Business date changes and full end-of-day execution, so interest and penalties calculate correctly.

Multi-day flows

Simulates month-end processes and multi-day operational flows no point-in-time tool can replicate.

Intelligent validation

Test Result Verification Scenarios observe the system directly rather than reading logs or replaying transactions — so TestNova reports that the process worked, not just that it ran.

- **Account balances —** Confirmed by direct post-execution observation
- **Accounting impacts —** Ledger entries and journals against expectations
- **Limits —** Credit and transactional limit states
- **Statuses —** Account, loan and process progression

Reduced manual effort

Less busywork, more judgement

Outcome-focused accuracy

Verifies balances and accounting impacts

Audit-ready evidence

Logs, reports and screenshots per run

Accessible to all teams

Business users and QA, no technical bottleneck
