TestNova

Banking automation that actually works like a bank.

TestNova is a specialised end-to-end automation platform built for the integrated complexity of modern banking. It validates entire business processes, not just code, so you deploy with confidence, speed, and full audit-ready evidence.

Executive Summary

Bridging the gap in banking automation

Traditional automation tools focus on code logic. Banking runs on business processes. TestNova bridges that gap,validating entire workflows across integrated banking systems to build stakeholder confidence, accelerate deployment, and ensure compliance at every step.

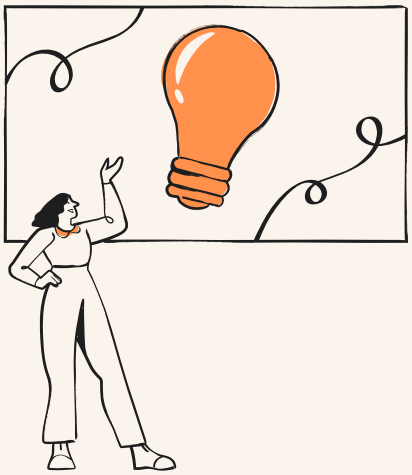

Confidence through validation

Validates entire processes under realistic conditions, reducing operational surprises and building trust across teams.

Risk mitigation & compliance

Ensures outcomes meet strict regulatory and operational standards, minimising risks from complex system dependencies.

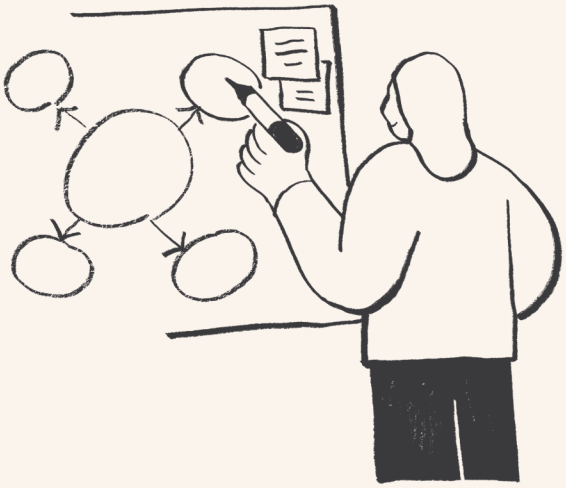

Faster time to market

Accelerates business sign-off and reduces the burden of manual checking so new products launch faster.

Operational safety

Catches critical defects that traditional script-based tools miss, particularly in multi-day and multi-system workflows.

The Problem

Traditional tools test code. Banks run on processes.

Most automation platforms were designed for product development, they validate code logic in isolation using fixed, static data. Banking is fundamentally different. A single loan origination touches multiple systems simultaneously, spans multiple business days, and changes continuously as interest accrues, penalties apply, and statuses shift. Generic tools miss all of this.

TestNova is built on the understanding that Business Usage testing is fundamentally different from Product Development testing and it is the only platform designed specifically for that distinction.

Traditional tools

❌Validates code logic in isolation

❌Uses fixed, static test data

❌Checks if the script ran

❌No awareness of time or EOD cycles

❌Tests one system at a time

❌No audit-ready evidence generation

TestNova

✅Validates integrated business processes end-to-end

✅Uses dynamic, date-sensitive data

✅Verifies if the bank actually worked

✅Simulates multi-day workflows and EOD cycles

✅Orchestrates across all connected systems simultaneously

✅Auto-generates logs, reports, and screenshots per run

Architecture

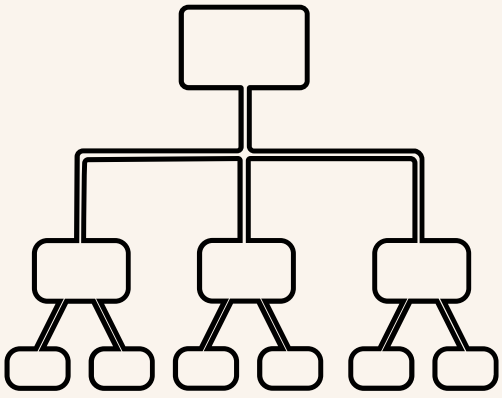

Three levels that mirror how a bank operates.

TestNova uses a unified architecture that organises automation into three easy-to-manage levels, designed around operational workflows, not technical file structures. Runs are versioned and tracked through statuses such as Draft, Ready for Execution, and Archived, and users can easily re-run them with updated data sets at any time.

1.Scenarios

A Python script paired with an Excel data sheet. Each row = one unique execution. The atomic unit of testing.

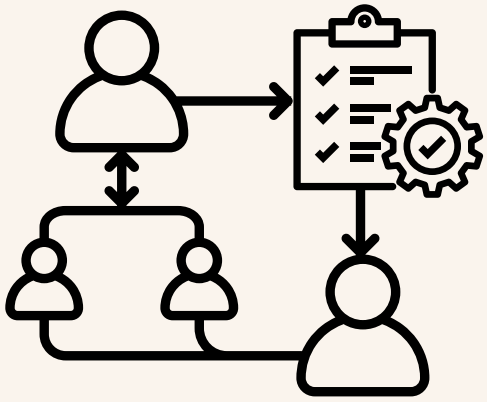

2.Business Processes

A sequence of Scenarios chained together to mirror a real banking workflow e.g. full loan origination

3.Test Runs

Scheduled execution of a Business Process with a chosen data set. Versioned, tracked, and fully automated.

Time aware testing

Mastering time - date handling and EOD cycles

A major and commonly overlooked pitfall in banking automation is the failure to capture temporal variation. Banking processes are inherently time-dependent, interest accrues, penalties apply, compliance windows open and close, and End-of-Day processing changes system states overnight. Static test data is blind to all of this.

TestNova is specifically time-aware, replacing static limitations with Dynamic Business Date handling, combining Test Start Dates (TSD) with Relative Business Dates to keep tests accurate as the calendar moves.

Simulating Date Progression

Simulates the passage of business days, allowing banks to validate loan servicing, interest accruals, and compliance cycles accurately over time.

EOD Cycle Handling

Supports business date changes and full End-of-Day execution to ensure interest and penalties calculate correctly across timeframes.

Multi Day Workflow Testing

Can simulate month-end processes and multi-day operational flows that no point-in-time testing tool can replicate.

Dynamic Business Dates

Relative Business Date logic ensures tests remain valid even as the live environment evolves, no manual data refreshing required.

Intelligent Validation

Verification through observation - not just execution.

TestNova changes the way results are checked by separating the doing from the checking. Business processes are executed once; outcomes are then validated using specialised Test Result Verification Scenarios (TRVS) that observe the system directly rather than reading log files or replaying transactions.

This means TestNova does not just tell you the process ran, it tells you the process worked. Multiple outcome checks are consolidated into a single verification flow, mirroring exactly how a real business user would validate a result.

What is verified	How it works
Account Balances	Direct system observation post-execution confirms correct balance outcomes
Accounting impacts	Ledger entries and journal impacts verified against expected outcomes
Limits	Credit and transactional limit states checked across relevant system states
Statuses	Account, loan, and process statuses validated to confirm correct progression

Value Proposition

Solving the banking efficiency crisis

Banking teams face severe time constraints, often having only a few weeks for User Acceptance Testing (UAT) before a go-live deadline. TestNova is built to solve this directly by providing tools that are intuitive enough for business experts to operate while remaining powerful enough for dedicated QA professionals.

1.Reduced Manual Effort

Shifts the team's focus from repetitive, manual execution to intelligent verification. Less busywork, more judgment.

2.Outcome Focused Accuracy

Doesn't just check if a script ran, verifies if the bank worked by confirming final balances and accounting impacts.

3.Audit Ready Evidence

Every execution automatically generates the detailed reporting, logs, and screenshots required for regulatory compliance.

4.Accessible to all teams

Designed for business users and QA professionals alike, no bottleneck at the technical team during critical UAT windows.

Six Pitfalls Solved

Every major banking automation failure - addressed.

TestNova is specifically designed to overcome the six most common challenges that cause banking automation projects to fail or miss critical defects before go-live.

✅ Static Data Failure

Dynamic, date-sensitive data handling replaces fixed inputs that break as time moves and system states change.

✅ Missing Processes

True end-to-end business process testing, not just isolated script execution, catches integration failures before production.

✅ Slow Manual Validation

Automated TRVS verification and built-in reporting eliminate repetitive human checking entirely.

✅ System Complexity

Cross-system orchestration validates dependencies across all connected applications simultaneously.

✅ Multi Day Hardship

Time-aware testing with EOD simulation handles temporal workflows that no static tool can replicate.

✅ Inflexible Re-Running

Easy scheduling and automatic re-runs with updated data sets make the testing lifecycle fully adaptable.
