1. Introduction

1.1 Purpose

Online Transaction Auditing (OTA) application is designed to meet the unique requirements of auditing bank transactions. This application facilitates the users to audits various transactions (limited) & static data (limited) such as Essence transaction, Customer static data auditing, and Account auditing. The system also allows the users to open multiple screens in the form tabs simultaneously, thus enabling the users to work efficiently in parallel with multiple approach. With the capability to run multiple instances at once, users can enhance their productivity and streamline their workflow through this application.

1.2 Revision History

ACTION	NAME	DATE	NOTES	VERSION
Create	Rahul	11 Nov 2024	Initial draft	1.0
Update	Guhan	20 Dec 2024	CBS - branch, user incorporate	2.0
Update	Guhan	28 Feb 2025	M wallet and Mapper Config removal	3.0
Update	Guhan	21 May 2025	Transaction Exclusion Code List Config Introduction. Updated screenshots.	4.0
Update	Aravinth	10 Nov 2025	User Security Matrix	5.0
Update	Aravinth	9-01-2026	Requested changes for USM	6.0

2. Who Should Use the Manual

This manual is specifically tailored for auditors and inspectors working within the banking sector. It provides essential guidelines and procedures to ensure compliance and facilitate thorough evaluations of banking operations.

3. Process Overview

In the Auditor login, auditors can review records categorized by different types, but they can only access records linked to their assigned branch. In contrast, the Inspector login allows inspectors to verify the loaded data and review records audited by the auditors. Inspectors have access to records from all branches.

4. Logging in to the OTA Application

On the login screen, staff members can log in using their username and password. After logging in, they will be directed to the dashboard screen. Additionally, they can change the theme of the screen by clicking the button in the top right corner.

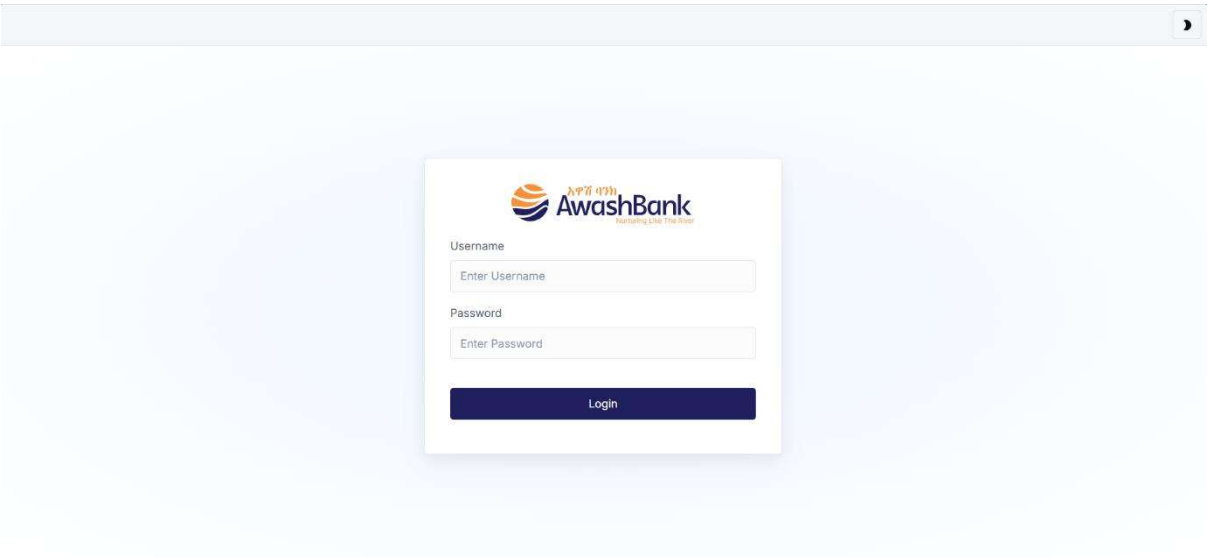

Fig 4.1 Login Screen

5.Dashboard Screen

Upon successful Login the following dashboard appears for the user the dashboard screen.

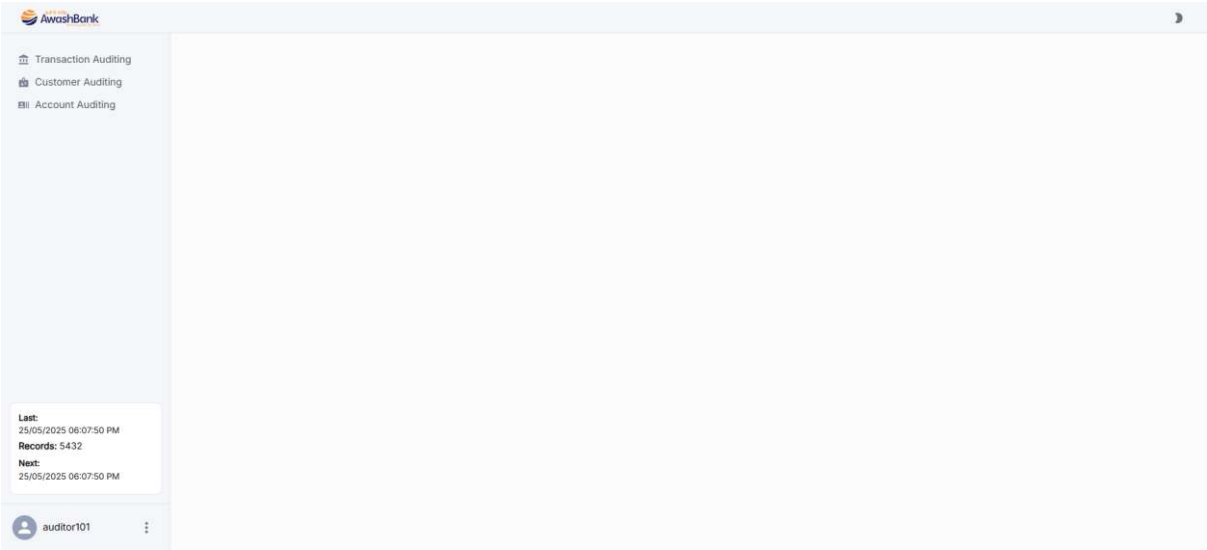

Fig 5.1 Dashboard Screen

5.1 Switching the theme

By clicking the button in the top right corner of the screen, users can switch the theme of the application.

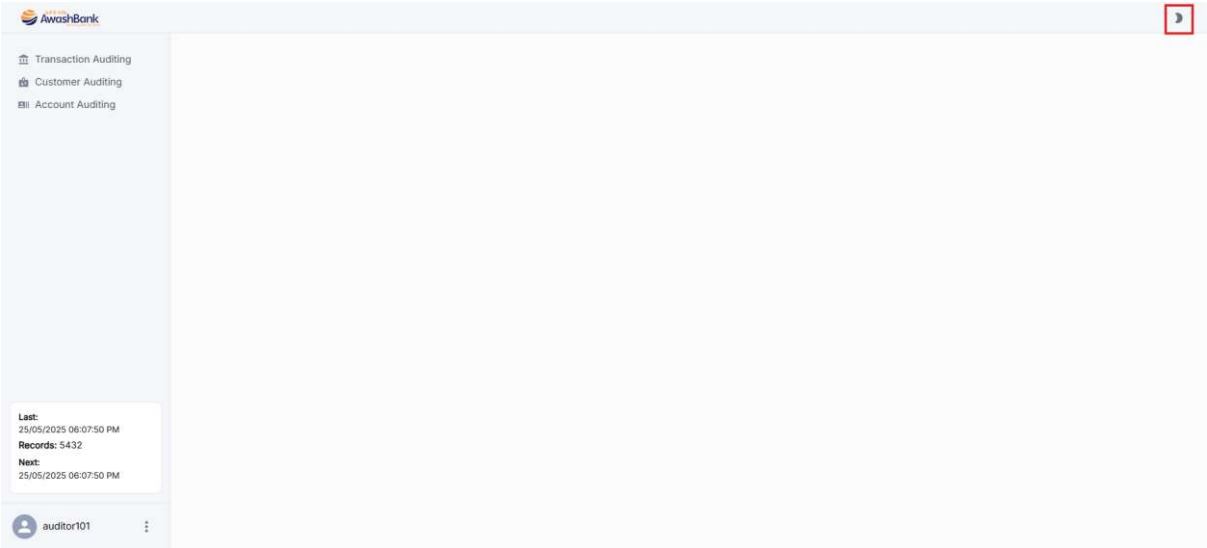

Fig 5.2 Dashboard Screen – Switch theme

5.2 Navigation menus

From this dashboard user will be able to navigate to any screen from the left navigation menu.

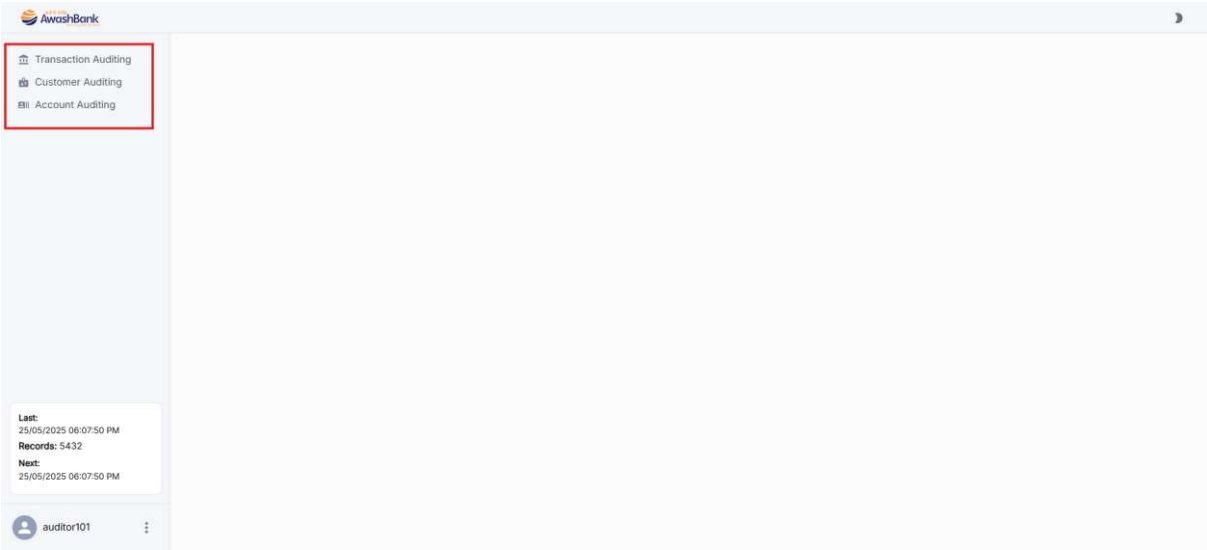

Fig 5.3 Dashboard Screen – Navigation menus

5.3 Notification box

In this notification box, users can view details such as the time at which the data was synced to the application, the number of records synced, and the expected time for the next data sync.

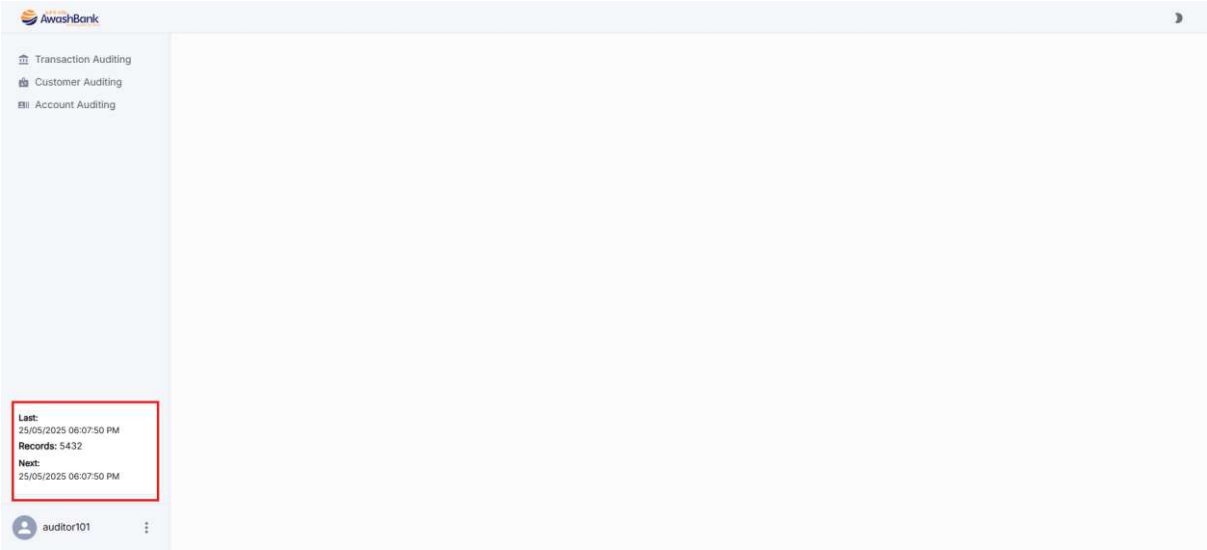

Fig 5.4 Dashboard Screen –Notification Box

5.4 User info part

In the bottom left corner of the screen, users can see their logged-in username.

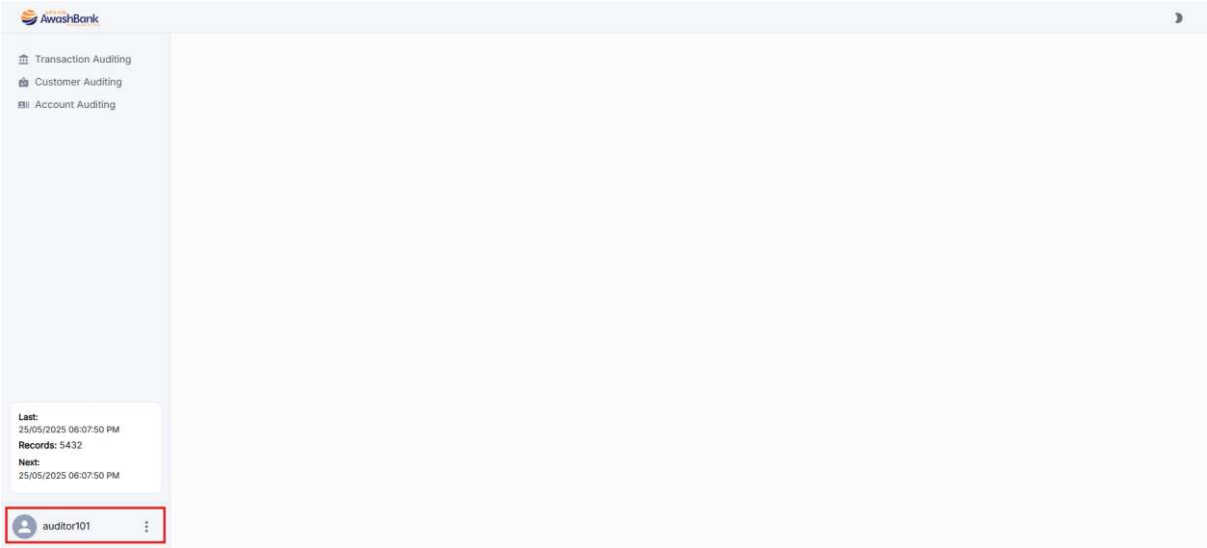

Fig 5.5 Dashboard Screen – User info part

5.5 Session logout

By clicking on the three dots near the username, users will see an option labelled "Logout." Clicking this button will allow them to log out of their session.

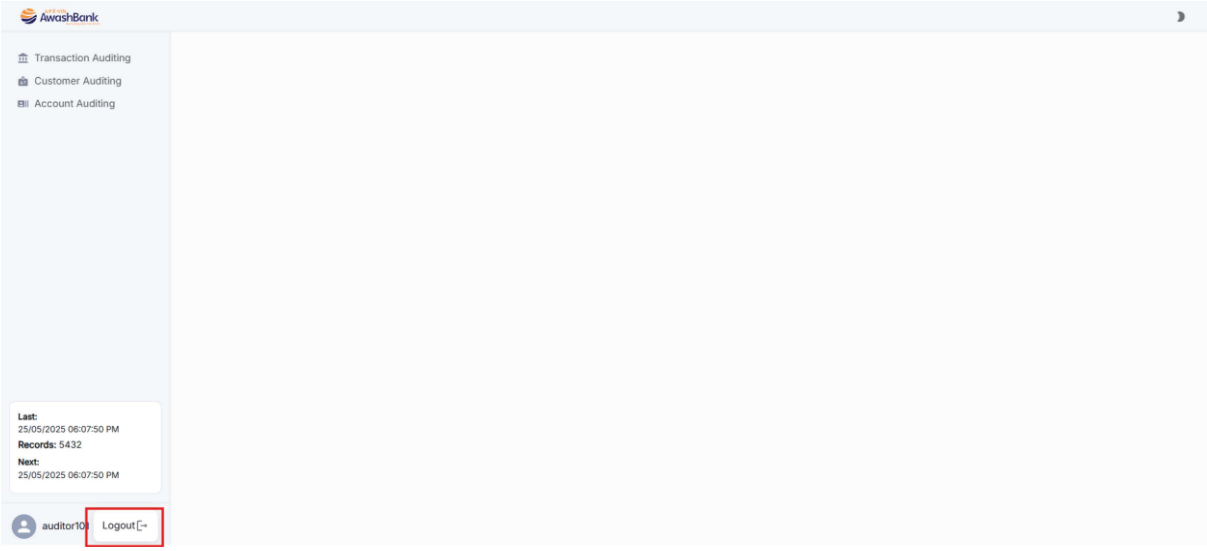

Fig 5.6 Dashboard Screen – Session logout

6. Transaction Audit Screen

Upon clicking on the Transaction Auditing Button from the side navigation menu, we could be able to get Transaction Auditing screen.

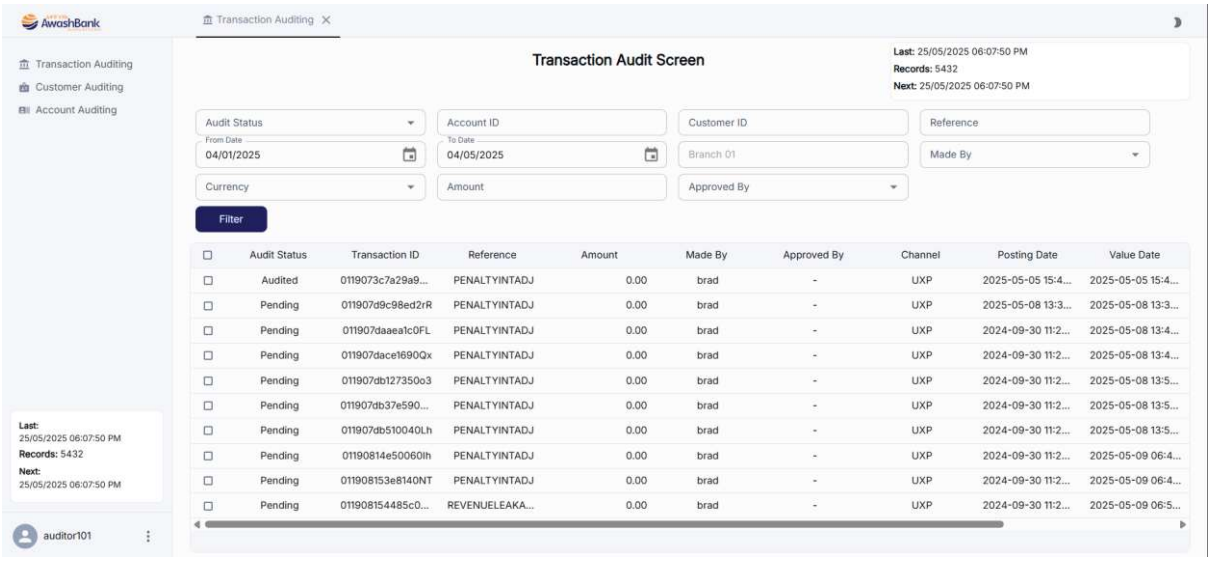

Fig 6.1 Transaction Audit Screen

6.1 Data synchronization and timing

In this Data synchronization and timing box, users can view details such as the time at which the data was synced to the application, the number of records synced, and the expected time for the next data sync.

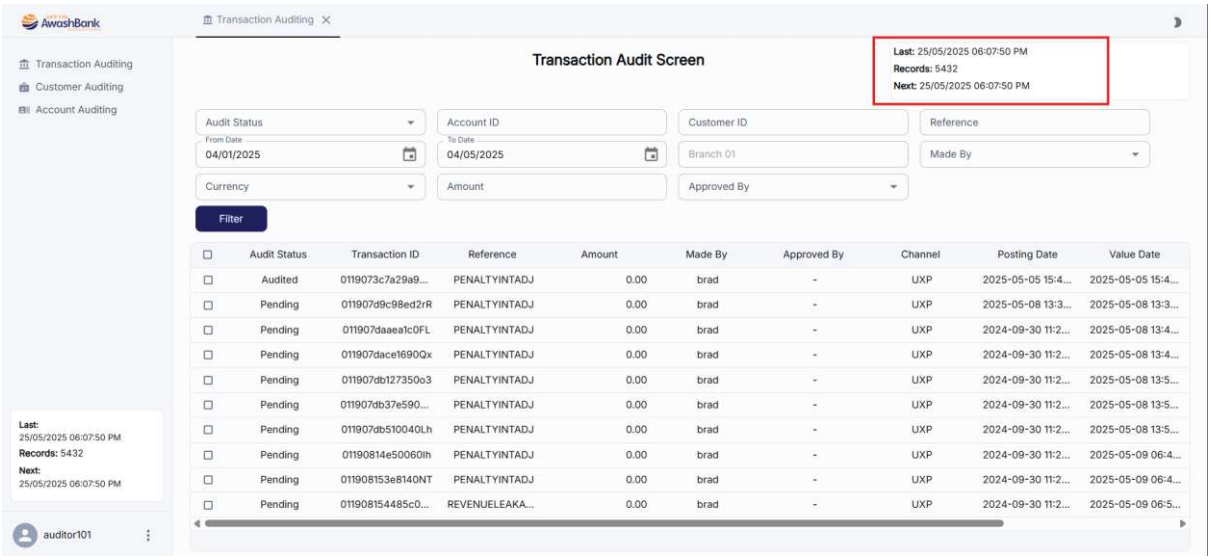

Fig 6.2 Transaction Audit Screen - Data synchronization and timing

6.2 Filtering the data

In the filter section of the Transaction Audit Screen, users can filter data using various criteria. By entering details in the input fields and clicking the Filter button, users can retrieve data based on the selected filters.

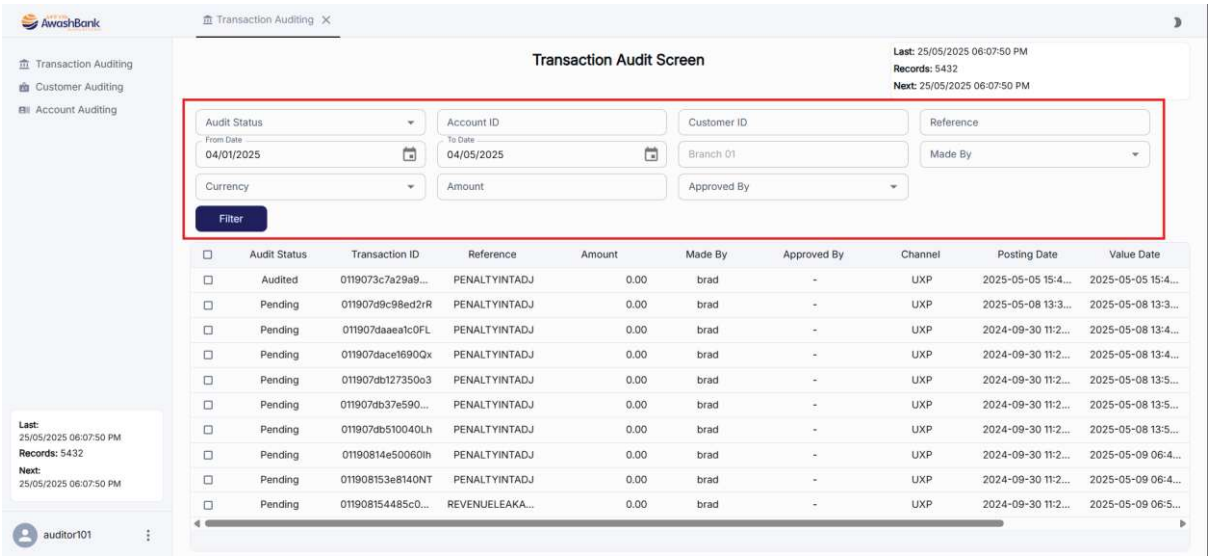

Fig 6.3 Transaction Audit Screen – Filtering the data

6.3 Visualising the Transaction Data in the table

In the table displayed on the screen, users can visualize all the transaction auditing records.

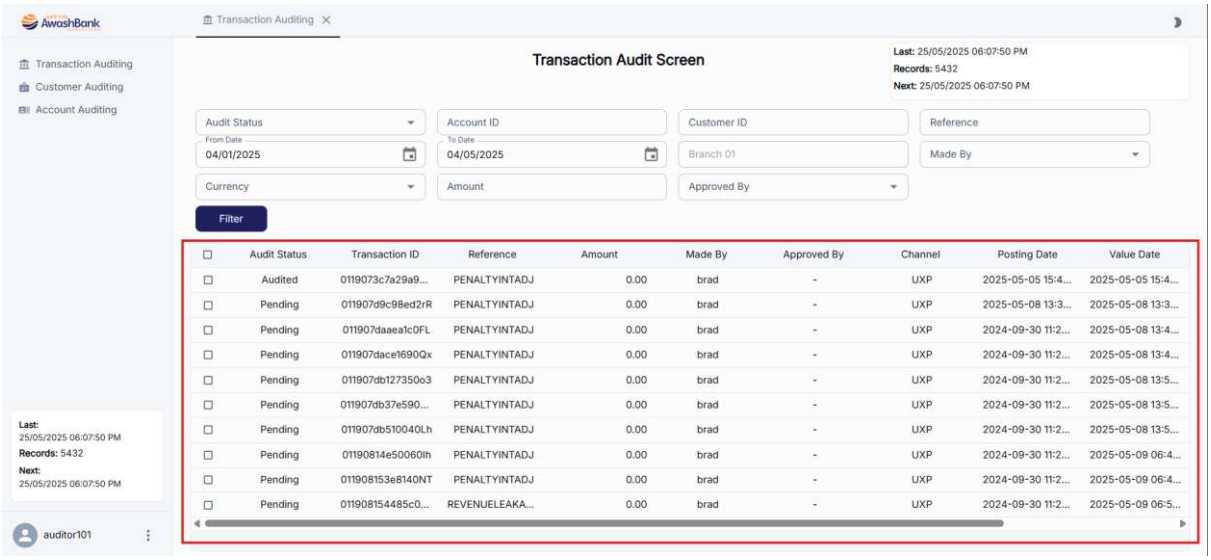

Fig 6.4 Transaction Audit Screen – Visualising the Transaction Data in the table

6.4 Auditing the Transactions

Users can audit records by selecting transactions, adding comments, and clicking the Audit button. A success message will display upon successful auditing, while an error message will appear if the transaction has already been audited.

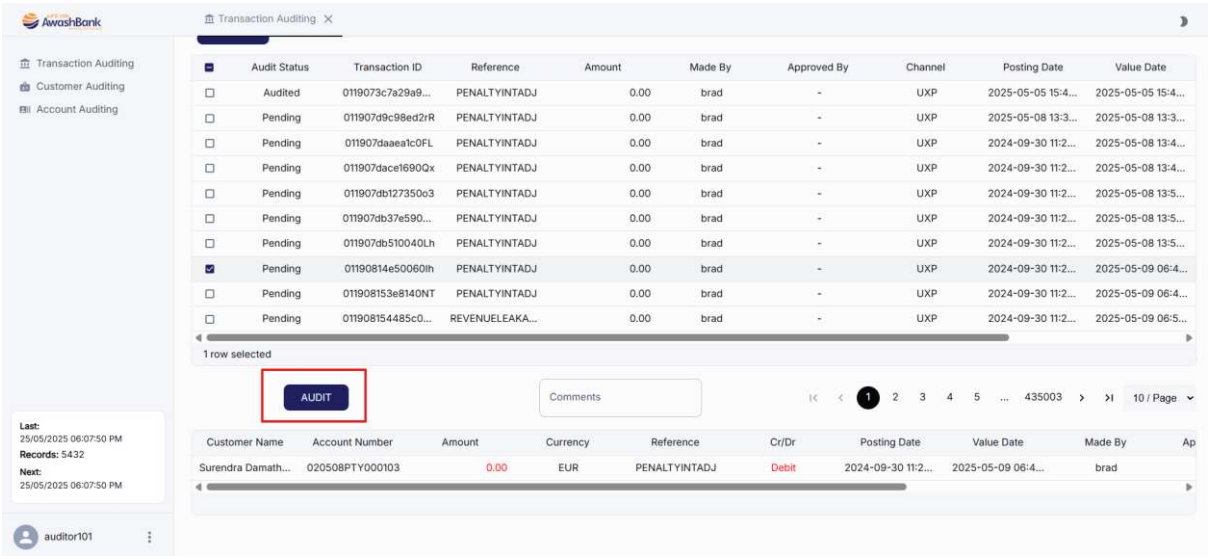

Fig 6.5 Transaction Audit Screen - Auditing the transaction

6.5 Visualising more details of a Transaction

By clicking the 'View Details' button on the screen, we can view the transaction data in detail.

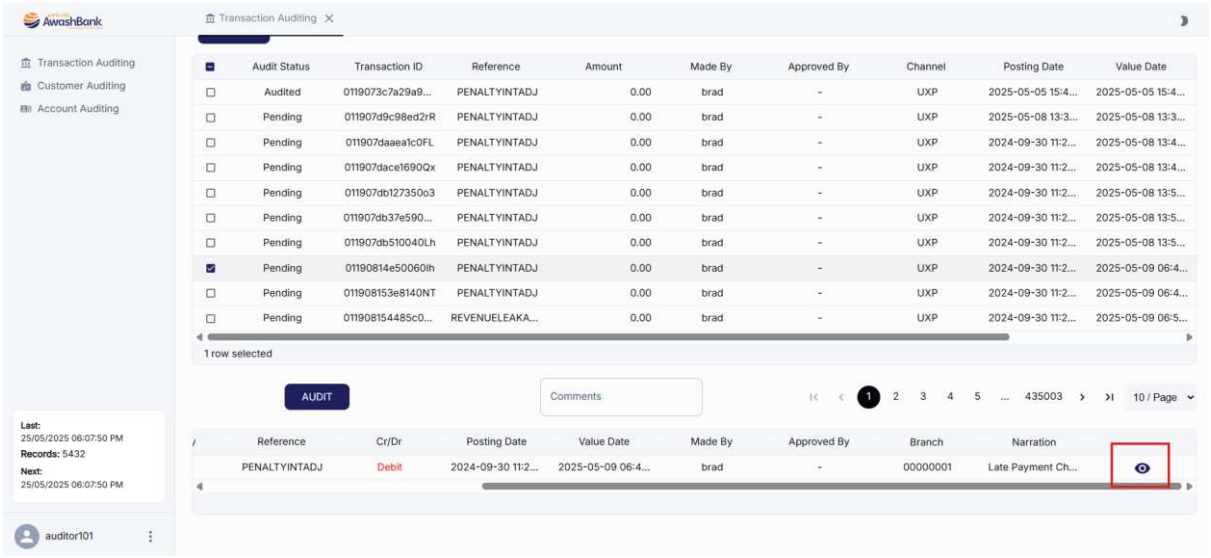

Fig 6.6 Transaction Audit Screen – View Details Button

The data of the selected transaction can be viewed in detail, as shown below.

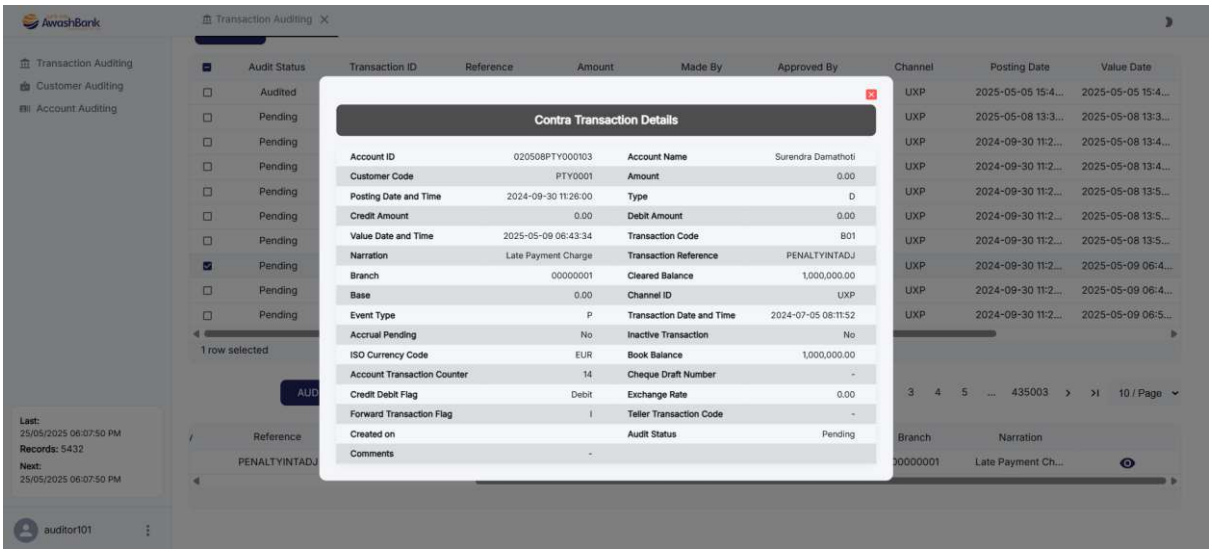

Fig 6.7 Transaction Audit Screen – View Details

6.6 Switching between different pages

The user can switch pages by clicking on the page numbers in the pagination bar.

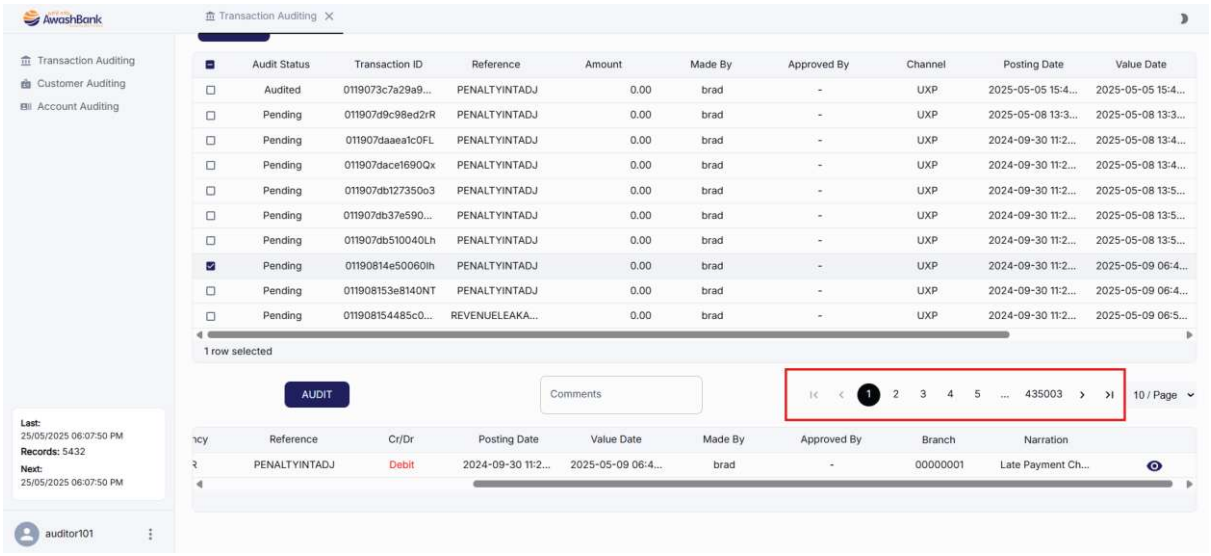

Fig 6.8 Transaction Audit Screen – Switching Pages

6.7 Selecting total no. of records to be loaded per page

The user will have the privilege to change the number of records to be loaded in the table by selecting an option from the displayed dropdown.

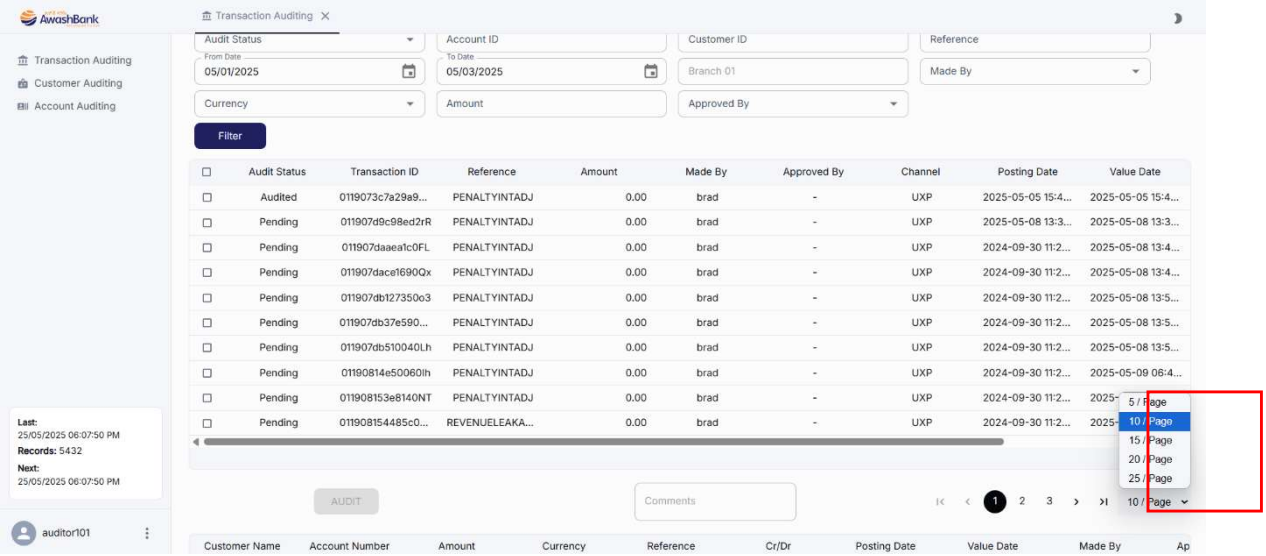

Fig 6.9 Transaction Audit Screen – Selecting number of records

6.8 Visualising the Contra Transaction Data in the table

Once a transaction is selected, the contra transaction will be displayed at the bottom of the transaction table. If multiple transactions are selected, the contra details of the last selected transaction will be shown.

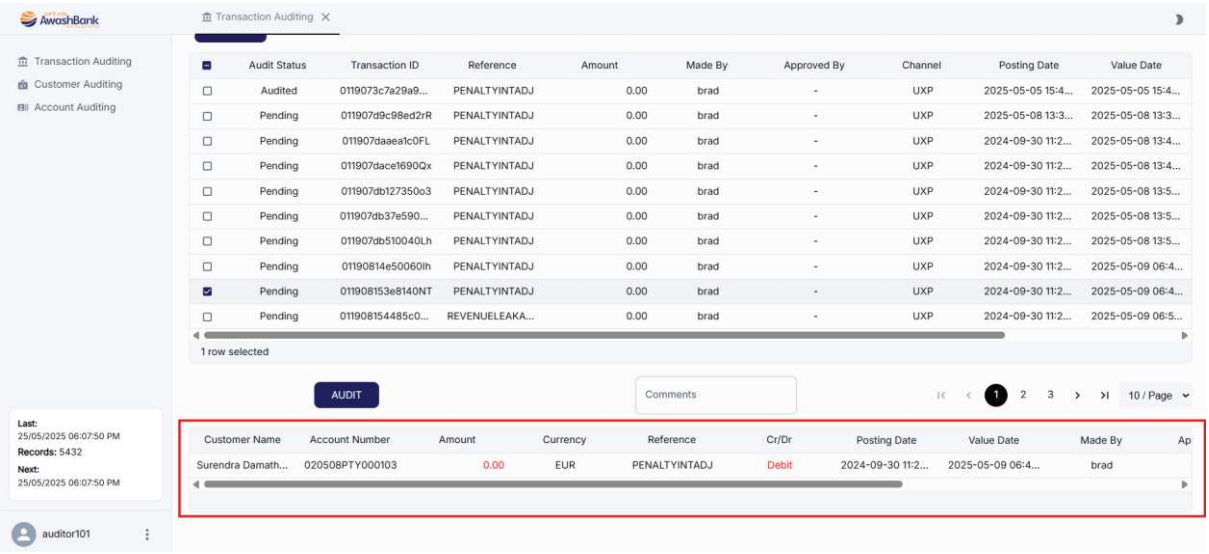

Fig 6.10 Transaction Audit Screen – Contra Transaction Table

6.9 Visualising more details of a Contra Transaction

By clicking the eye button next to the records, we can view the details of the particular transaction in detail.

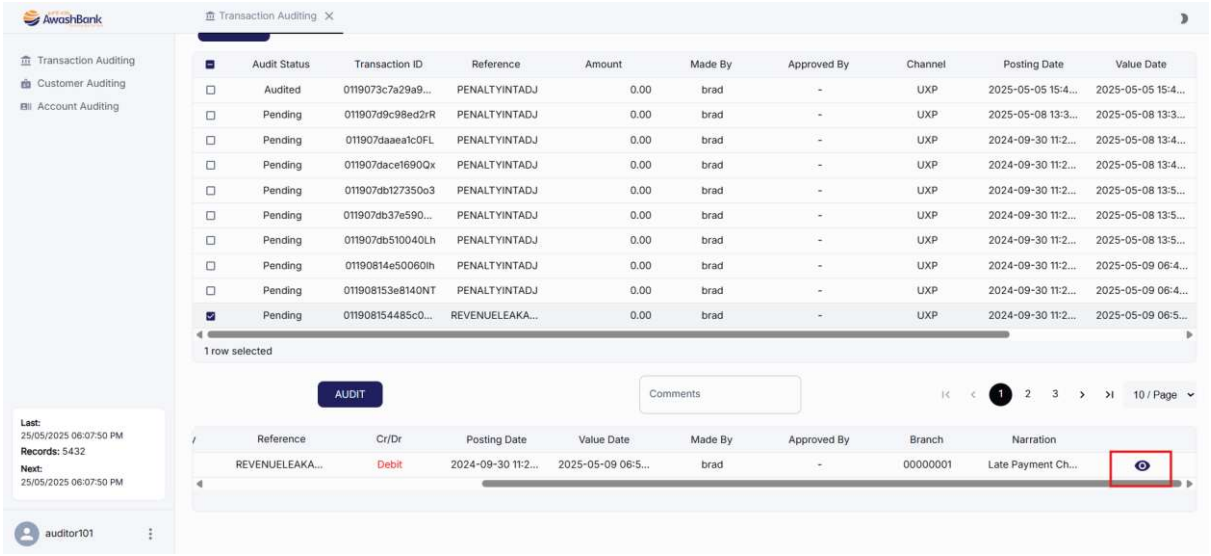

Fig 6.11 Transaction Audit Screen – View Contra Details Button

The data of the selected contra transaction can be viewed in detail, as shown below.

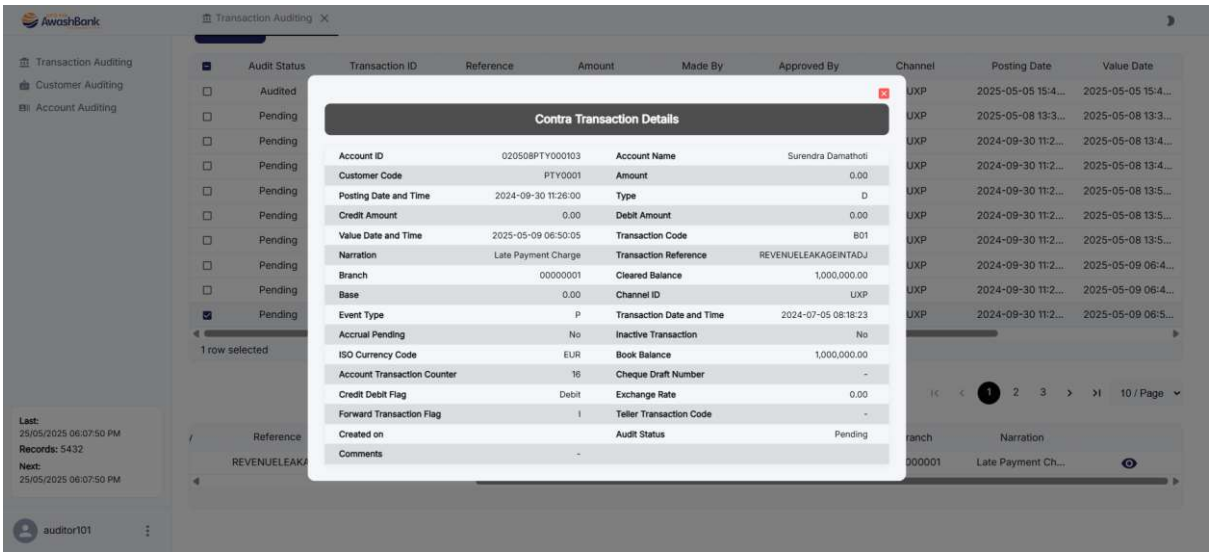

Fig 6.12 Transaction Audit Screen – View Contra Details

6.10 Transaction Exclusion Code List

It is possible to exclude selected transactions to copy/move from the core banking system to the OTA System by specifying the desired transaction codes in the **transactionExclusionList.properties** file. To set up this functionality kindly refer to the **Deployment & Configuration** section briefed in the latest **OTA & Poller System Installation Guide** version.

7. Customer Static Data Auditing Screen

Upon clicking on the Customer Auditing Button from the side navigation menu, we could be able to get Customer Static Data Auditing screen.

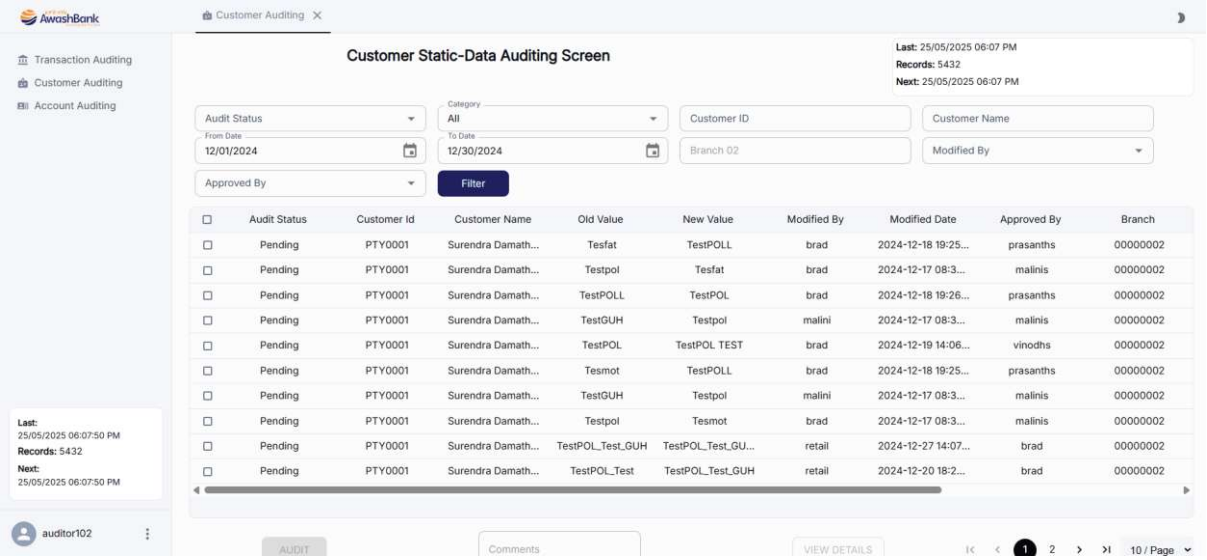

Fig 7.1 Customer Audit Screen

7.1 Data synchronization and timing

In this Data synchronization and timing box, users can view details such as the time at which the data was synced to the application, the number of records synced, and the expected time for the next data sync.

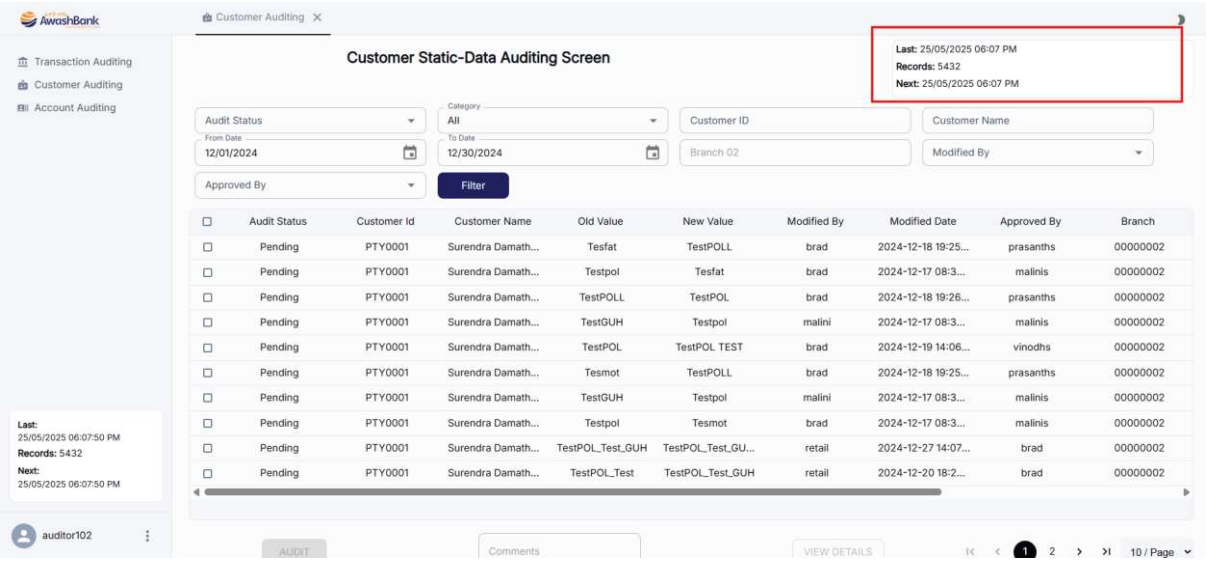

Fig 7.2 Customer Audit Screen - Data synchronization and timing

7.2 Filtering the data

In the filter section of the Customer Audit Screen, users can filter data using various criteria. By entering details in the input fields and clicking the Filter button, users can retrieve data based on the selected filters.

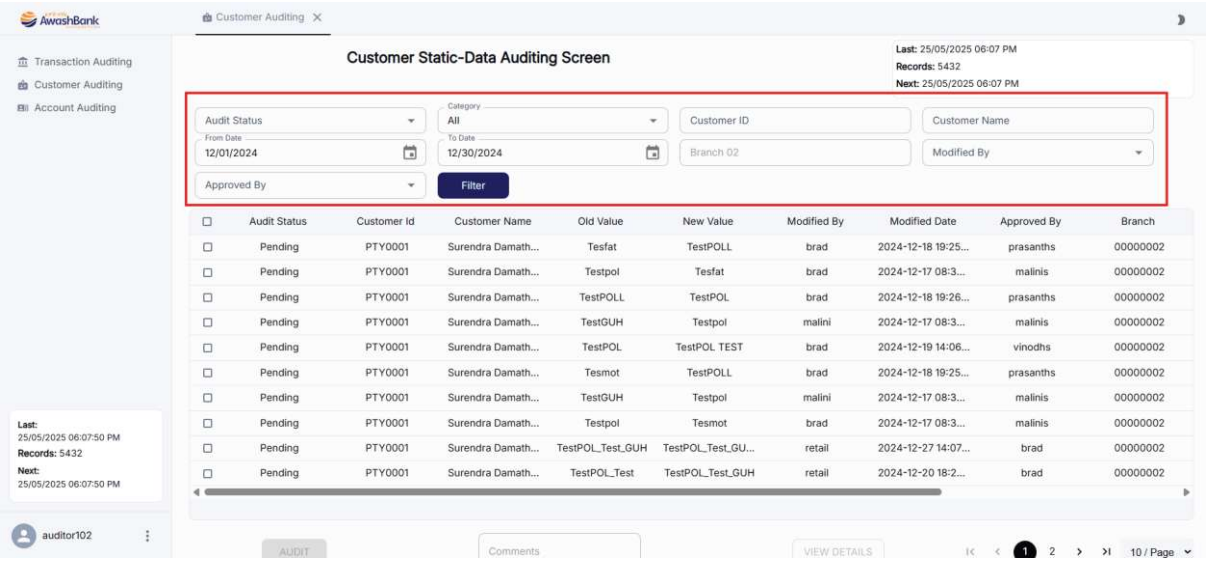

Fig 7.3 Customer Audit Screen – Filtering the data

7.3 Visualising the Customer Static Audit Data

In the table displayed on the screen, users can visualize all the customer auditing records.

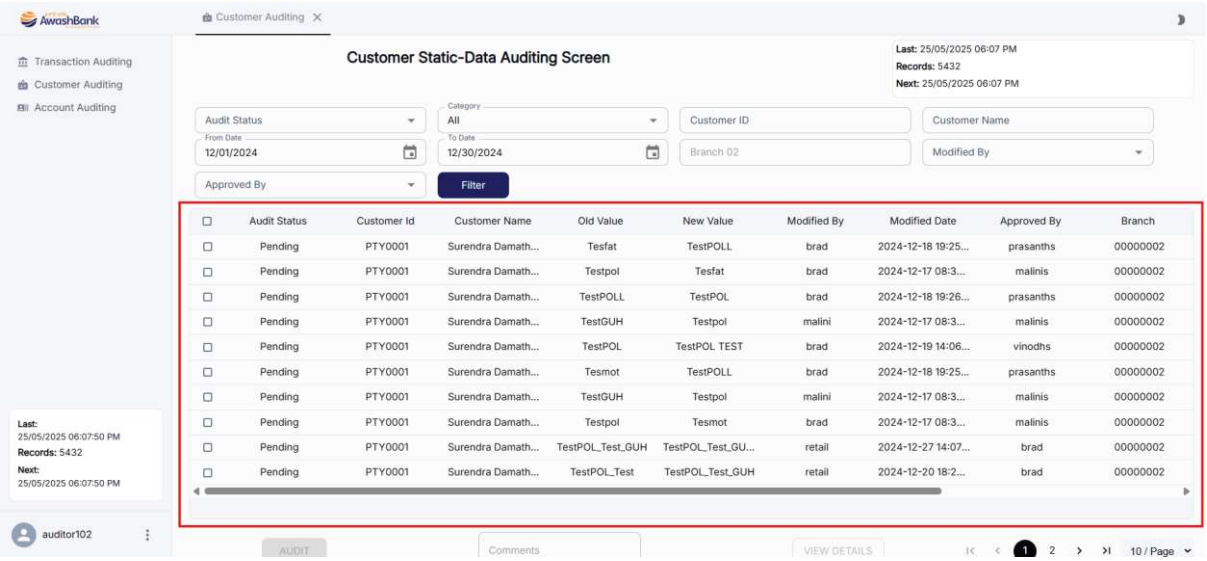

Fig 7.4 Customer Audit Screen – Visualising the Customer static Audit Data

7.4 Auditing the Customer Static Data record

Users can audit records by selecting customer static data, adding comments, and clicking the Audit button. A success message will display upon successful auditing, while an error message will appear if the record has already been audited.

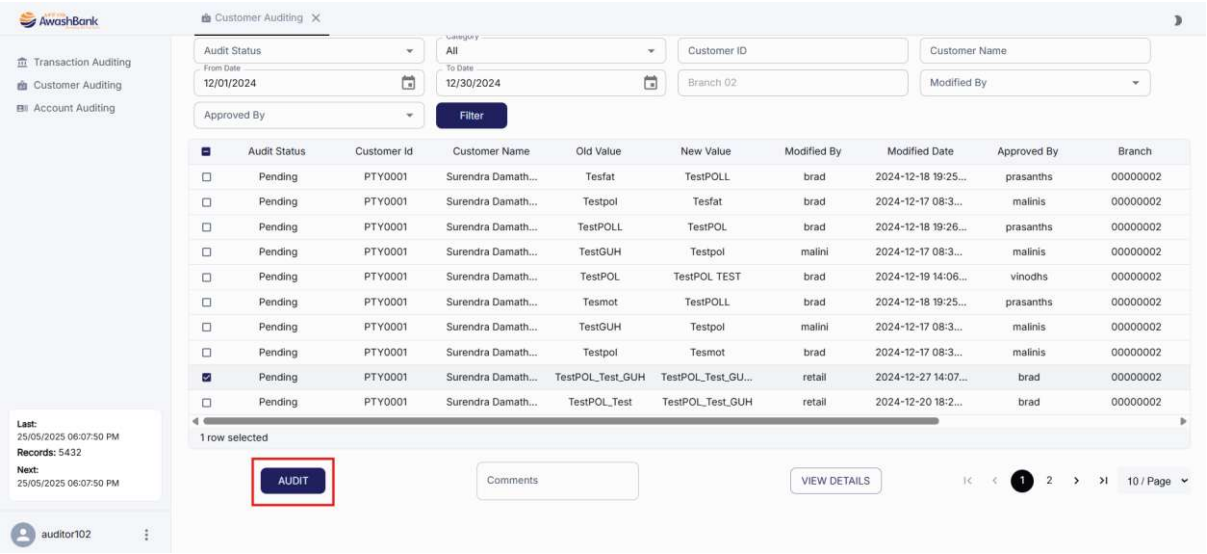

Fig 7.5 Customer Audit Screen – Auditing the Customer Static Data record

7.5 Visualising more details Customer Static Data

By clicking the 'View Details' button on the screen, we can view the customer data in detail.

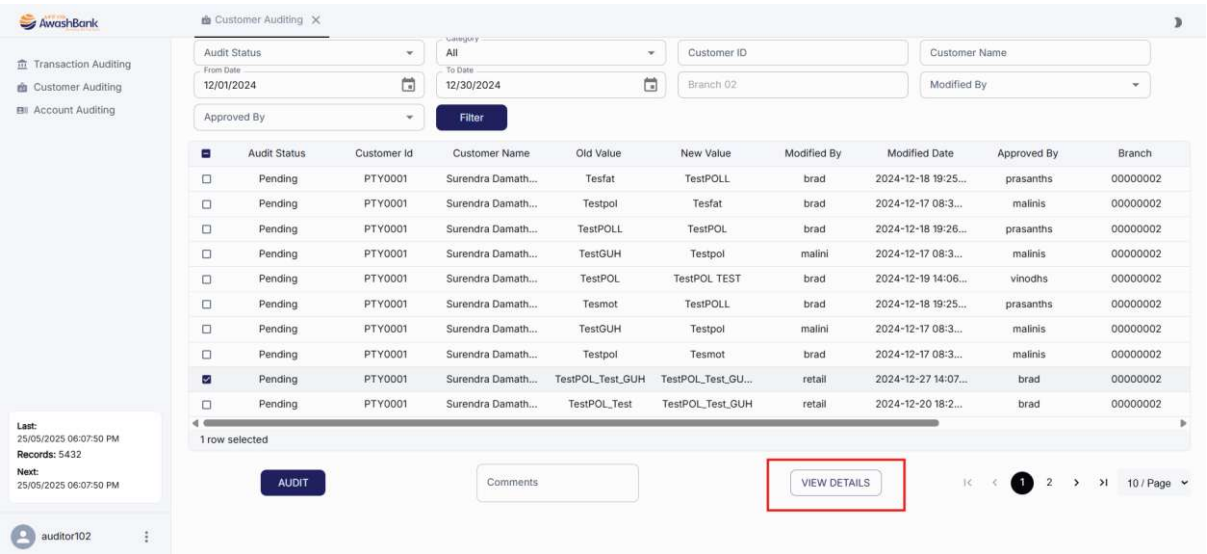

Fig 7.6 Customer Audit Screen – View Details Button

The data of the selected customer record can be viewed in detail, as shown below.

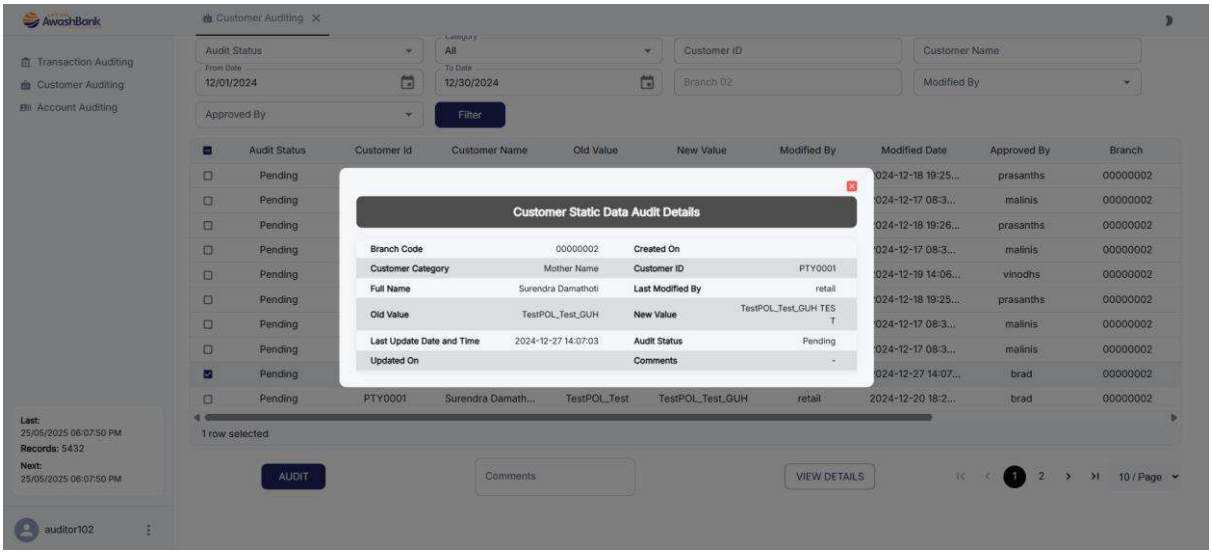

Fig 7.7 Customer Audit Screen – View Details

7.6 Switching between different pages

The user can switch pages by clicking on the page numbers in the pagination bar.

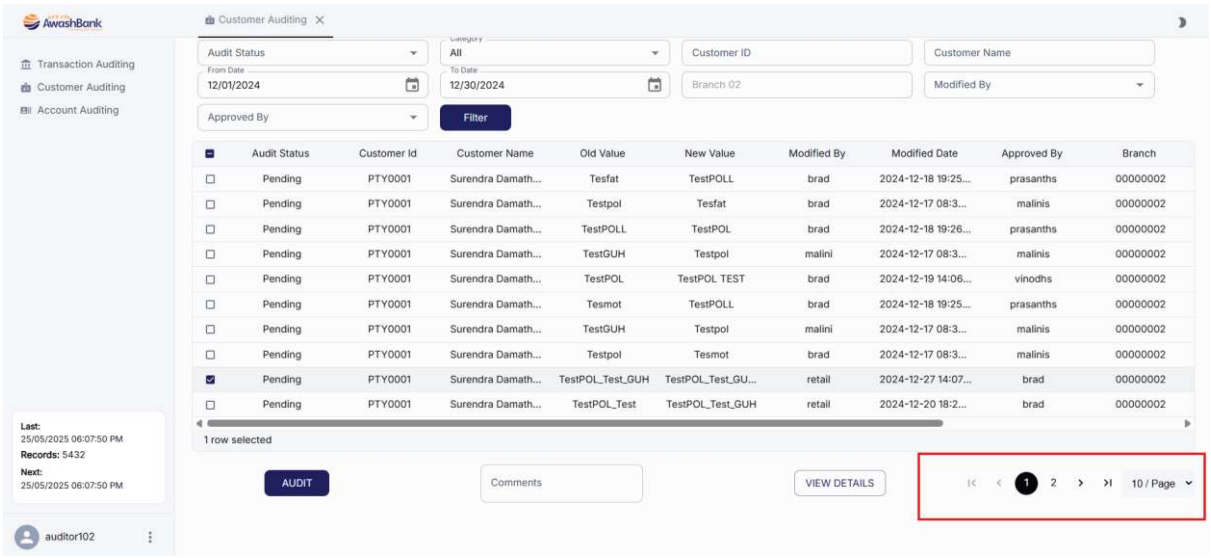

Fig 7.8 Customer Audit Screen – Switching Pages

7.7 Selecting total no. of records to be loaded per page

The user will have the privilege to change the number of records to be loaded in the table by selecting an option from the displayed dropdown.

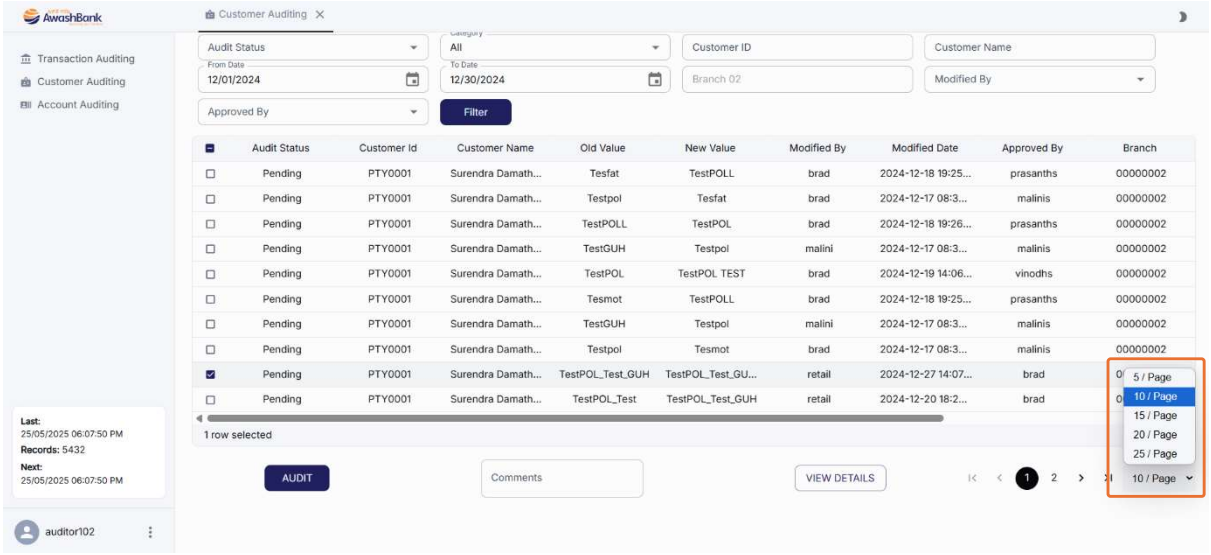

Fig 7.9 Customer Audit Screen – Selecting number of records

8. Account Audit Screen

Upon clicking on the Account Auditing Button from the side navigation menu, we could be able to get Account Data Auditing screen.

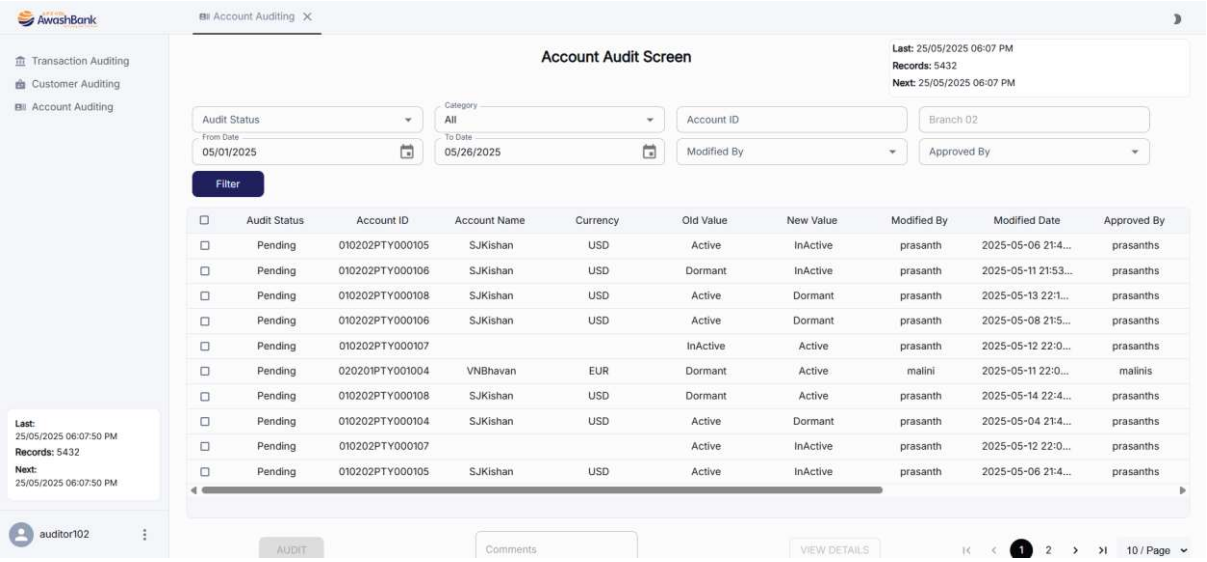

Fig 8.1 Account Audit Screen

8.1 Data synchronization and timing

In this Data synchronization and timing box, users can view details such as the time at which the data was synced to the application, the number of records synced, and the expected time for the next data sync.

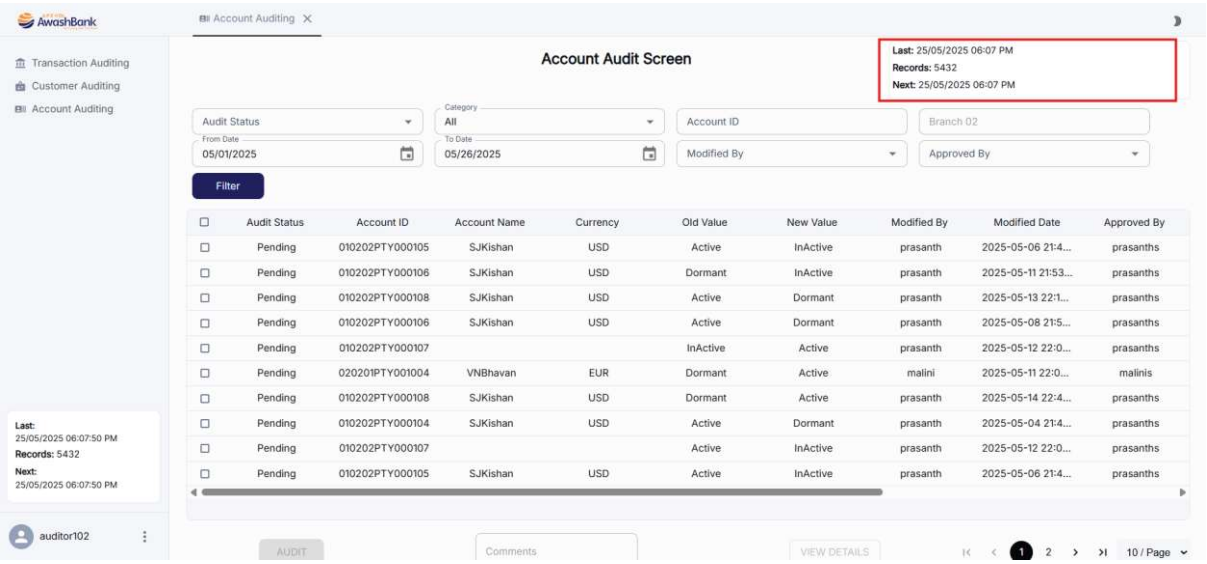

Fig 8.1 Account Audit Screen - Data synchronization and timing

8.2 Filtering the data

In the filter section of the Account Audit Screen, users can filter data using various criteria. By entering details in the input fields and clicking the Filter button, users can retrieve data based on the selected filters.

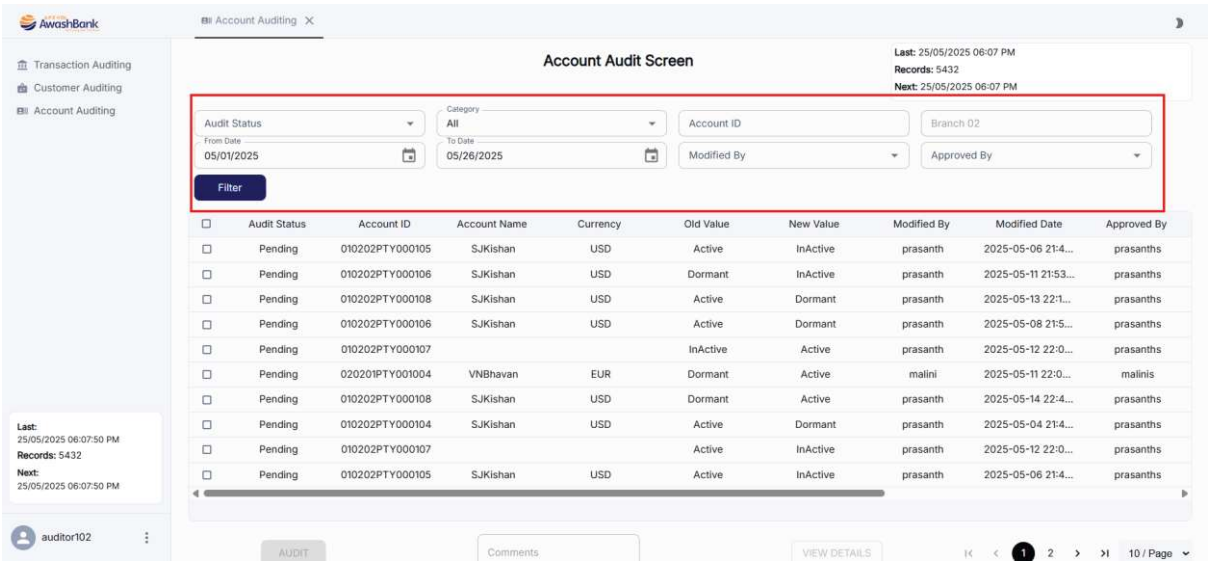

Fig 8.2 Account Audit Screen – Filtering the data

8.3 Visualising the Account Audit Data

In the table displayed on the screen, users can visualize all the Account auditing records.

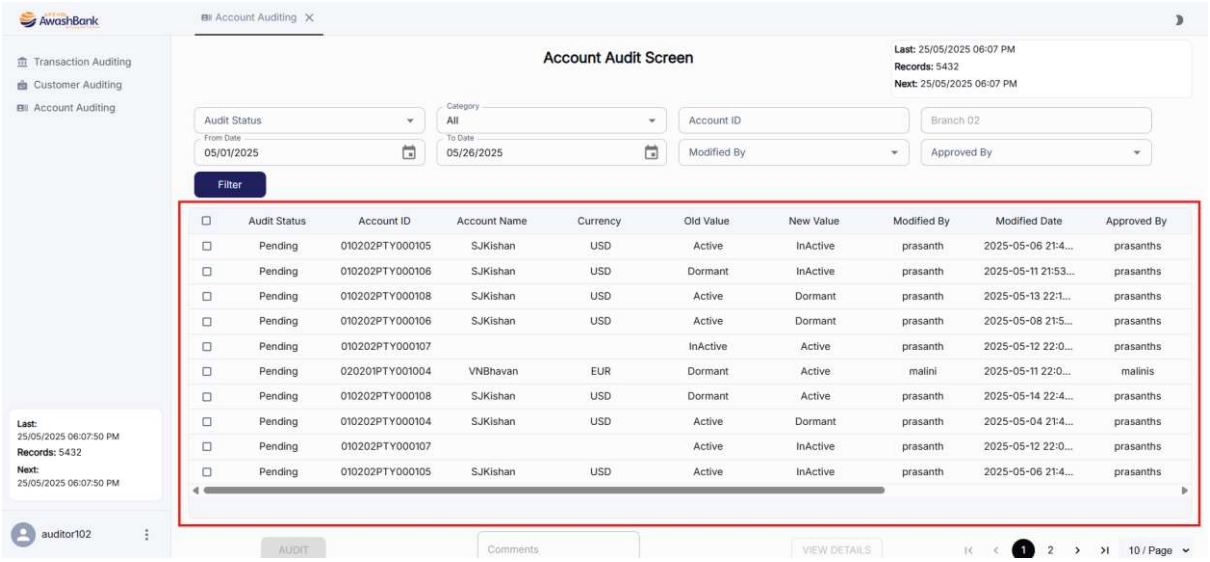

Fig 8.3 Account Audit Screen – Visualising the Account Audit Data

8.4 Auditing the Account Data record

Users can audit records by selecting Account data, adding comments, and clicking the Audit button. A success message will display upon successful auditing, while an error message will appear if the record has already been audited.

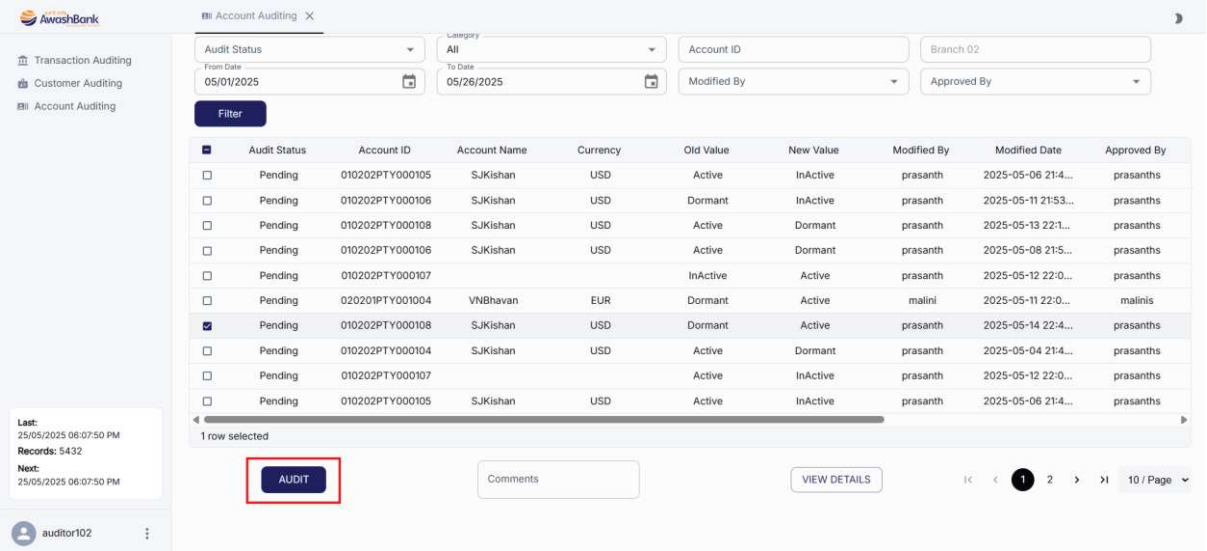

Fig 8.4 Account Audit Screen – Auditing the Account Data record

8.5 Visualising more details Account Data

By clicking the 'View Details' button on the screen, we can view the Account data in detail.

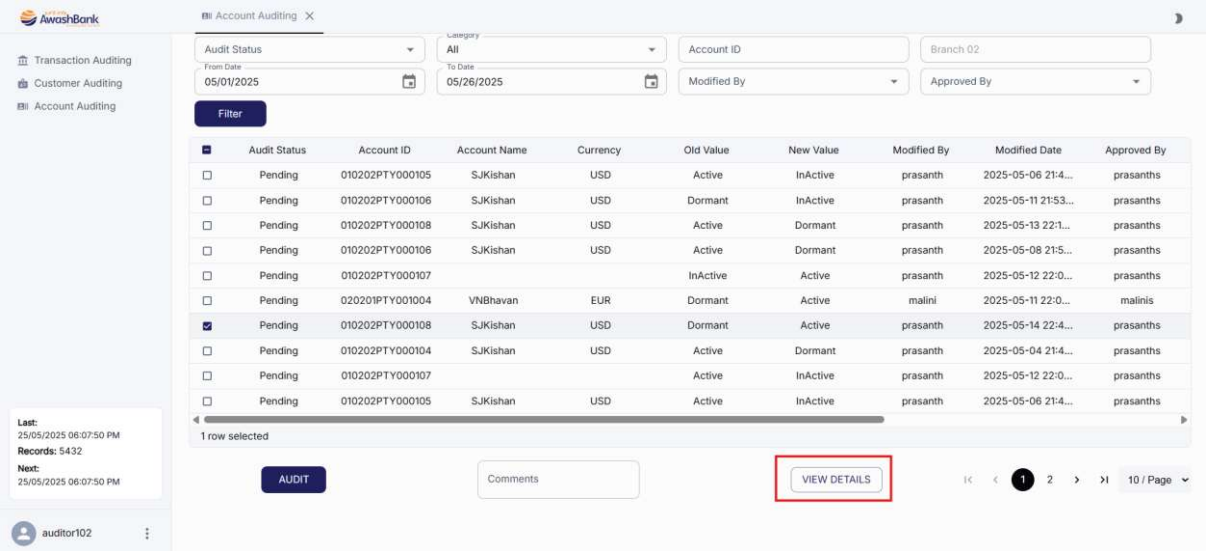

Fig 8.5 Account Audit Screen – View Account Details

8.6 Switching between different pages

The user can switch pages by clicking on the page numbers in the pagination bar.

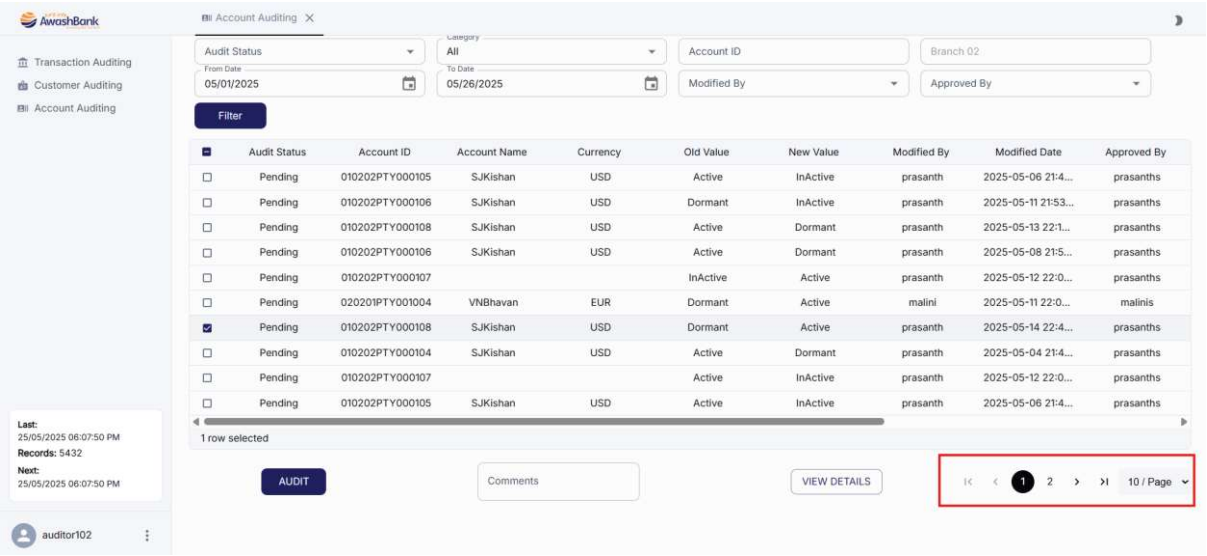

Fig 8.6 Account Audit Screen –Switching between pages

8.7 Selecting total no. of records to be loaded per page

The user will have the privilege to change the number of records to be loaded in the table by selecting an option from the displayed dropdown.

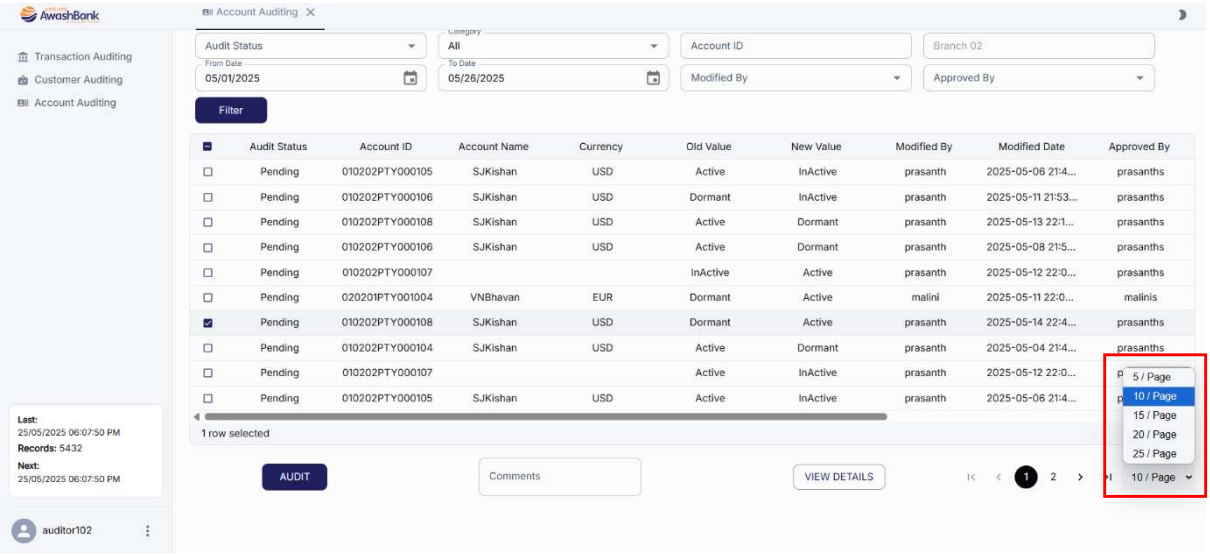

Fig 8.7 Account Audit Screen – Selecting number of records

9. Module Configuration:

The Database Module Configuration for Date Validation ensures that date-related data entries are properly validated before being stored in the database. It allows the configuration of date formats, range constraints (e.g., ensuring dates fall within a specific range), and time zone handling. This module ensures that dates are consistent, properly formatted, and compatible with the database schema. Configurations can be adjusted for different environments to account for regional differences or application-specific requirements.

Note: Whenever new changes are made to the module configuration cache must cleared if the OTA system is up and running (Cache Clear must done through provided API).

10. User Security Matrix – USM

This USM defines how users, roles, permissions, and resources are structured in the system.

It helps to clearly understand who can access what, and how each user role (Admin, IT - Team, Auditor, Inspector) operates across different parts of the application.

10.1 Overview:

The system follows a **Role-Based Access Control (RBAC)** model to ensure secure and structured access.
Each user is assigned one or more **roles**, and each role defines a set of **permissions** that determine what the user can see or do.

10.2 Core Entities:

Entity	Description
Users	Represents individual users who can log in and use the system.
Roles	Define what a user is allowed to do — for example, audit data or manage users.
Permissions	Represent specific privileges linked to one or more resources.
Resources	Represent system assets such as APIs, UI screens, or widgets associated with permissions.

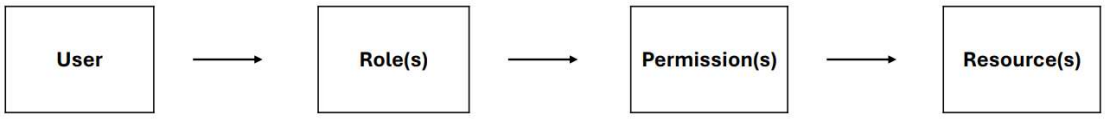

Fig: 10.1 Visual relationship between Users, Roles, Permissions, and Resources.

10.3 Role Categories:

Category	Description	Typical Access
Admin	Manages Roles, Permissions, and Resources.	Create & Amend system entities.
IT – Team	Manages Users.	Create and Amend Users
Auditor	Has access to view and **audit (modify)** data within assigned modules.	Read & Write (Audit) access in respective modules.
Inspector	Has access to **view only** the data within assigned modules.	Read-only access in respective modules.

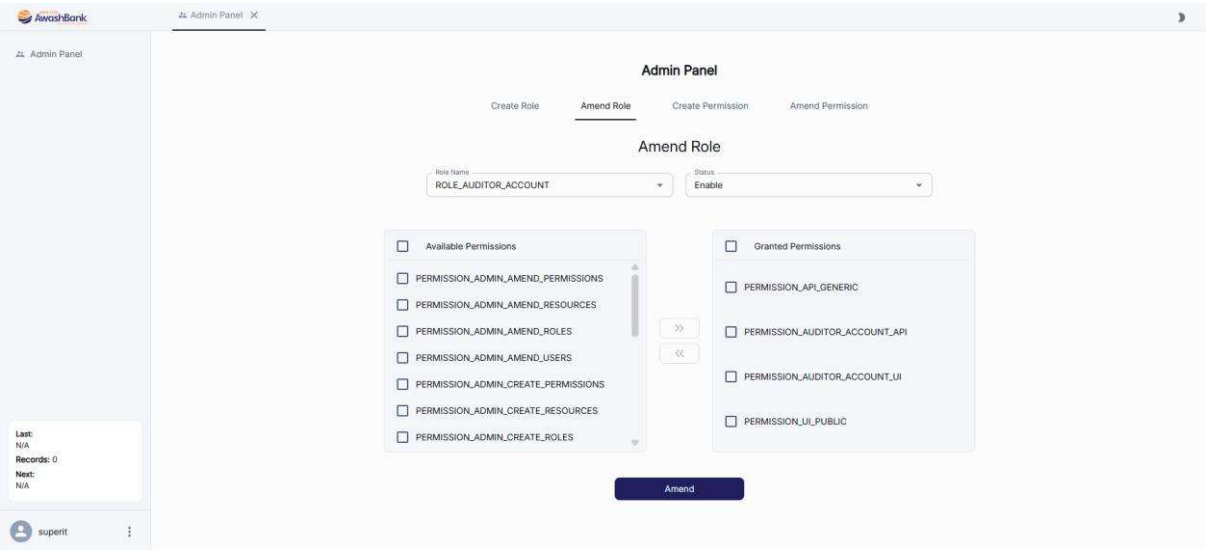

Fig: 10.1 Admin viewing and managing system roles with assigned permissions.

10.4 Defined Roles:

Role	Description
ROLE_ADMIN	Can manage Roles, Permissions, and Resources (system-level control). Cannot view or audit business data.
ROLE_IT	Can manage Users. Cannot view or audit business data.
ROLE_TRANSACTION_AUDITOR	Can view and audit data in the Transaction module.
ROLE_CUSTOMER_AUDITOR	Can view and audit data in the Customer module.
ROLE_ACCOUNT_AUDITOR	Can view and audit data in the Account module.

ROLE_TRANSACTION_INSPECTOR	Can view data in the Transaction module only.
ROLE_CUSTOMER_INSPECTOR	Can view data in the Customer module only.
ROLE_ACCOUNT_INSPECTOR	Can view data in the Account module only.

10.5 Defined Permissions:

PERMISSION_API_GENERIC	Grants access to common/shared API endpoints.
PERMISSION_UI_PUBLIC	Grants access to basic UI components available to all users.
PERMISSION_ADMIN_CREATE_USERS	Allows creation of new users.
PERMISSION_ADMIN_AMEND_USERS	Allows modification and management of existing users.
PERMISSION_ADMIN_CREATE_ROLES	Allows creation of new roles.
PERMISSION_ADMIN_AMEND_ROLES	Allows modification and management of existing roles.
PERMISSION_ADMIN_CREATE_PERMISSIONS	Allows creation of new permissions.
PERMISSION_ADMIN_AMEND_PERMISSIONS	Allows modification and management of existing permissions.
PERMISSION_ADMIN_CREATE_RESOURCES	Allows creation of new protected resources.
PERMISSION_ADMIN_AMEND_RESOURCES	Allows modification and management of existing resources.
PERMISSION_AUDITOR_TRANSACTION_UI	Allows Transaction Auditors to view and audit transaction-related UI screens.
PERMISSION_AUDITOR_TRANSACTION_API	Grants Transaction Auditors API-level audit access for transaction data.
PERMISSION_AUDITOR_CUSTOMER_UI	Allows Customer Auditors to view and audit customer-related UI screens.
PERMISSION_AUDITOR_CUSTOMER_API	Grants Customer Auditors API-level audit access for customer data.
PERMISSION_AUDITOR_ACCOUNT_UI	Allows Account Auditors to view and audit account-related UI screens.
PERMISSION_AUDITOR_ACCOUNT_API	Grants Account Auditors API-level audit access for account data.
PERMISSION_INSPECTOR_TRANSACTION_UI	Allows Transaction Inspectors to view transaction-related UI screens (read-only).
PERMISSION_INSPECTOR_TRANSACTION_API	Grants Transaction Inspectors API-level read-only access for transaction data.
PERMISSION_INSPECTOR_CUSTOMER_UI	Allows Customer Inspectors to view customer-related UI screens (read-only).

PERMISSION_INSPECTOR_CUSTOMER_API	Grants Customer Inspectors API-level read-only access for customer data.
PERMISSION_INSPECTOR_ACCOUNT_UI	Allows Account Inspectors to view account-related UI screens (read-only).
PERMISSION_INSPECTOR_ACCOUNT_API	Grants Account Inspectors API-level read-only access for account data.

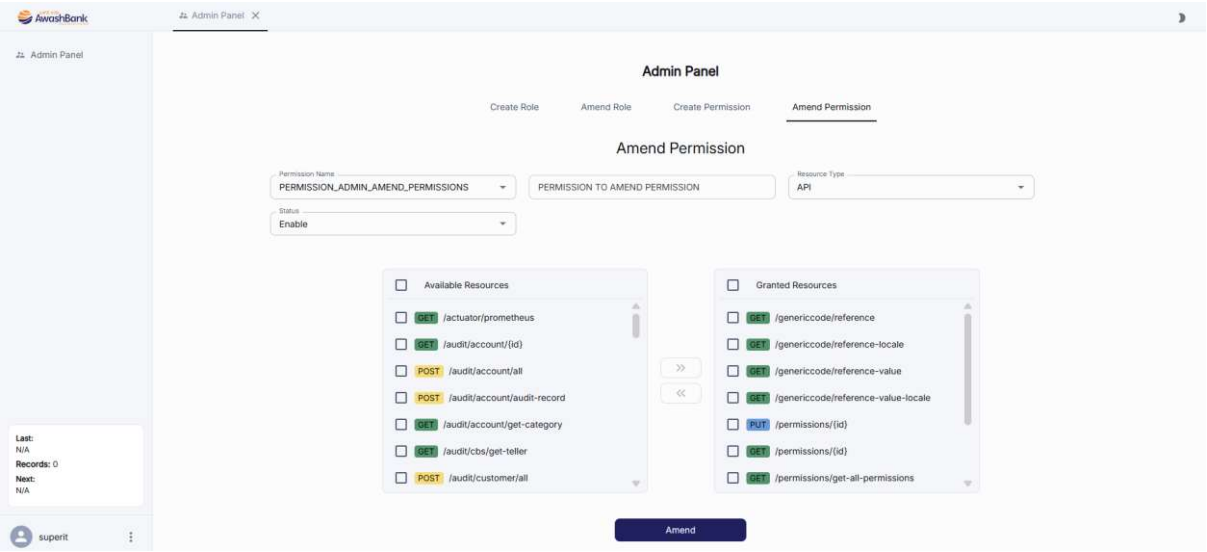

Fig: 10.2 UI view showing role-permission association.

10.8 User Onboard:

The User Onboarding module allows administrators to create new users in the system with essential identity and access details. It ensures that each user has a unique username and email, belongs to a valid branch, roles that can be granted and can be activated or deactivated as required.

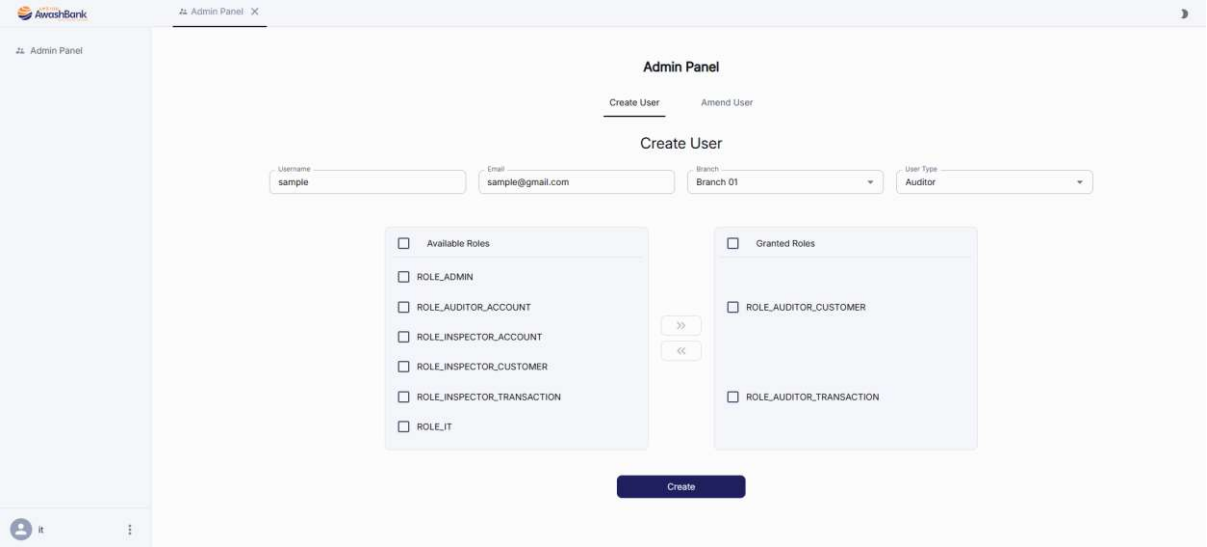

Fig: 10.3 User creation form with fields

Each user record provides the option to toggle between branches and status to ENABLE and DISABLE.

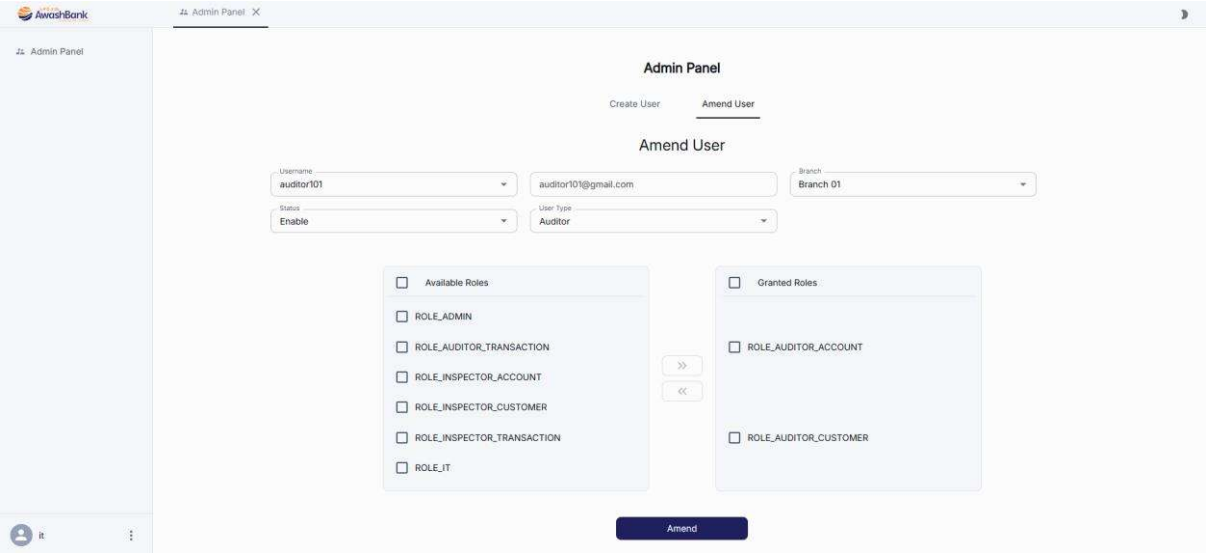

Fig: 10.4 User Amend form with fields

Note: Note on user creation [user onboarded via OTA UI should also be part of CAS/AD/LDAP configured otherwise user will not be able to login to the system]

10.9 Access Scenarios:

Admin Access

Example User: admin

- Can create, edit, or deactivate Roles and Permissions.
- Cannot access or audit module data (Transactions, Accounts, Customers).
- Controls overall security configurations.

IT - Team Access

Example User: ituser

- Can create, amend or deactivate Users.
- Cannot access or audit module data (Transactions, Accounts, Customers).

Auditor Access

Example User: John

- Role: ROLES_TRANSACTION_AUDITOR
- Access: Can view and audit Transaction data (e.g., verify and approve records).
- Permissions: PERMISSION_TRANSACTION_UI_AUDITOR, PERMISSION_TRANSACTION_API_AUDITOR.

Inspector Access

Example User: Alice

- Role: ROLES_TRANSACTION_INSPECTOR
- Access: Can view Transaction data but cannot edit or approve.
- Permissions: PERMISSION_TRANSACTION_UI_INSPECTOR, PERMISSION_TRANSACTION_API_INSPECTOR.
